Answers, Solution Outlines and Comments to Exercises Solutions to the exercises of the Algorithms book by Robert Sedgewick and Kevin Wayne (4th editon). I found the book to be an excellent resource to learning algorithms and data structures. Since there are not many (almost none) solutions of the exercises on the Internet and the only ones available are incomplete, I decided to share my work on the exercises.

I'd prefer a more math oriented text with solutions to at least some exercises to test my understanding. I am fairly proficient in Python having taken MIT's 6.001 on edx. But I cannot see how the instructors arrived at the algorithms they present and thus think I need to go deeper into the study of algos on my own. The algorithm runs in linear time since it takes $O(m)$
time (where m is the number of edges) to go over
each vertex to calculate the degree of the vertex, and
 $O(m)$ time to go over them again and sum the
degrees of vertices to compute `twodegree[]`.

Therefore, the total time complexity is also $O(m)$.
