The Handy Answer Book for Kids (and Parents) Molecular Biology of the Cell What You Need to Know about Infectious Disease Janeway's Immunobiology Excerpt from Bacteria and the Germ Theory of Disease: Eight Lectures Delivered at the Chicago Medical College The invariable presence of bacteria in all putrefying material suggests their close relation to that process, but whether cause or result - can only be decided by experiment, not by observation alone. The experimental 'proof,' however, is so conclusive that it must be accepted as an axiom, that no putrefaction can occur without the presence of bacteria, and that bacteria are the sole and only cause of such decomposition. In order to demonstrate this truth, it has been found most convenient to make use of clear solutions. Of organic substances, for instance infusions of animal or vegetable tissues. All that has been learned in this manner applies equally to the decomposition of the original solid substances, but it is not so convenient to demonstrate it. For in transparent solutions. Bacteria can be detected more readily than on the surface of solids. Moreover the occurrence, or absence, of a turbidity in the previously clear fluid, is so suggestive of the presence of, or freedom from, bacteria, that the microscope need not be appealed to in every case. The first and most demonstrative result of such observations has been that putrefaction is arrested by any and all means, which arrest the development of bacteria. For the present let us merely consider the employment of heat for that purpose. Like all other living beings bacteria are killed by a sufficient heat.
