In 2000, total sales of software in the U.S. reached \$180 billion. Reducing the cost of software development and improving software quality are important objectives of the U.S. software industry.

However, the complexity of the underlying software needed to support the U.S.'s computerized economy is increasing at an alarming rate. Software nonperformance and failure are expensive, but it is difficult to define and measure software quality. The objective of this study is to investigate the economic impact of an inadequate infrastructure for software testing in the U.S. This study was undertaken as part of joint planning between NIST and industry to help identify and assess technical needs that would improve the industry's software testing capabilities. Air Quality Criteria for Carbon Monoxide

Transportation Infrastructure Engineering: A Multimodal Integration, intended to serve as a resource for courses in transportation engineering, emphasizes transportation in an overall systems perspective. It can serve as a textbook for an introductory course or for upper-level undergraduate and first-year graduate courses.

This book, unlike the widely used textbook, Traffic and Highway Engineering, serves a different purpose and is intended for a broader audience. Its objective is to provide an overview of transportation from a multi-modal viewpoint rather than emphasizing a particular mode in great detail. By placing emphasis on explaining the environment in which transportation operates, this book presents the big picture to assist students in understanding why transportation systems operate as they do and the role they play in a global society.
