The channel to which returned messages are sent. When provided, the underlying amqp template is configured to return undeliverable messages to the gateway. The message will be constructed from the data received from amqp, with the following additional headers:

amqp_returnReplyCode,
amqp_returnReplyText,
amqp_returnExchange,
amqp_returnRoutingKey.

AMQP 0-9-1 (Advanced Message Queuing Protocol) is a messaging protocol that enables conforming client applications to communicate with conforming messaging middleware brokers. Brokers and Their Role Messaging brokers receive messages from publishers (applications that publish them, also known as producers) and route them to consumers (applications that process them).

For objects that can be mapped to AMQP primitive types, the body is serialized into

AMQP data types. If the object cannot be directly mapped into an AMQP primitive type; that is, a custom type defined by the application, then the object is serialized using the `DataContractSerializer`, and the serialized bytes are sent in an AMQP data message.

The AMQ model consists of a set of components that route and store messages within the broker service, plus a set of rules for wiring these components together. A network wire-level protocol, AMQP, that lets client applications talk to the server and interact with the AMQ model it implements.

AMQP stands for Advanced Message Queuing Protocol and it is an open standard application layer protocol.

RabbitMQ implements version 0-9-1 of the specification today, with legacy support for version 0-8 and 0-9. AMQP was designed to efficiently support a wide variety of messaging applications and communication patterns.
