Tourism has huge significance as a global economic and social phenomenon, and given the growing reliance on the industry by service-dependent economies around the world, the lack of focus on tourism planning and development in South Asia is surprising. Current issues including social, environmental and cultural aspects underpinned by security challenges have defined the tourism development narratives in many South Asian countries over the last decades and lead to fluid demand and supply patterns. The appetite for and reliance on tourism growth is seen regardless of the numerous challenges faced by the region. Despite a rich and steady history of tourism and demand driven by numerous pull-destinations, most South Asian countries have not invested or benefitted from global tourism growth trends.

This volume celebrates the life and career of Gordon Rausser, pioneer and leader in natural resource economics, while critically overviewing the emerging literature in the field. As the chair of the Agriculture and Resource Economics department at UC Berkeley, Rausser led the transformation of the department from a traditional agricultural economics department to a diverse resource economics department addressing issues of agriculture, food, natural resources, environmental economics, energy, and development. This book builds on this theme, showcasing not only the scope of Rausser's work but also key developments in the field. The volume is organized into two parts. The first part speaks about the lessons of Gordon Rausser's career, in particular, his role as a leader in different spheres, his capacity to integrate teaching and entrepreneurship, and his impact on the world food system. The second part will address some of the significant developments in the field he contributed to and how it relates to his work. The chapters include contributions from modern leaders in the economics field and cover diverse topics from many subfields including public policy, public finance, law, econometrics, macroeconomics, and water resources. Providing an excellent reference, as well as a celebration of a pivotal figure in the field, this volume will be useful for practitioners and scholars in agricultural and resource economics, especially the many individuals familiar with Gordon Rausser and his career.

This book moves beyond seeing the commons in the past tense, an entity passed over from the public into the private, to reimagine the commons as a process, a contest of force, a reconstitution, and a site of convening practices. It highlights new spaces of gathering opening up, such as the digital commons, and new practices of being in common, such as community economies and solidarity networks. The commons is seen as a contested domain of the collective and as a changing way of being in common, with the balance poised in the tensile play between political economy and social innovation. The book focuses on the possibility of recovering a future in which more can be held by the many, focusing on three concepts: nation and nature as a commons, publics and rights, and bodies, concerning the management of lives and livelihoods. Across these three passage points, the book finds evidence of a commons under attack but also defended in fragile though promising ways. With contributions from leading scholars, this thought provoking book will be of great interest to students and scholars in geography, environmental studies, politics, anthropology, and cultural studies.

Global agricultural trade has increased significantly in value terms since 2000. Its pattern has also changed – emerging economies and developing countries play a bigger role in international markets, and South – South agricultural trade has expanded significantly. Climate change is expected to affect agriculture, food security and nutrition unevenly across countries and regions. Changes in comparative advantage in agriculture around the world will also affect international trade. This edition of The State of Agricultural Commodity Markets focuses on the complex and underexplored intersection between agricultural trade, climate change and food security. The report makes an important contribution to the policy debates on climate change adaptation and mitigation under the Paris Agreement and the multilateral agricultural trade rules. The report discusses policies – both domestic support and trade measures – that can promote food security, adaptation and mitigation, and improve the livelihoods of family farmers around the world. Given both the slow- and rapid-onset impacts of climate change, policies that can significantly promote climate change adaptation and mitigation would benefit from deeper discussions in international fora on how to strengthen the mutually supportive role of trade rules and climate interventions.

In this book, I have clearly pointed out that parental pressure acts as a significant stressors and appropriate level of Stress experienced by students due to challenging stimulus can lead to positive outcomes such as motivation and improved task performance, while threatening ones can result in anxiety, depression, and social dysfunction. The positive enjoyable and productive classroom climate helps the students to succeed in academic achievement in economics and develops their potentials and individuality. It is in the hands of the teachers to create a positive classroom climate, by considering carefully the basic principles of an effective classroom management plan. The roles of the school and teachers have always been vital in developing the students' innate potentials and all round personality development.

Feeding the world's growing human population is increasingly challenging, especially as more people adopt a western diet and lifestyle. Doing so without causing damage to nature poses an even greater challenge. This book argues that in order to create a sustainable food supply whilst conserving nature, agriculture and nature must be reconnected and approached together. The authors demonstrate that while the links between nature and food production have, to some extent, already been recognized, until now the focus has been to protect one from the impacts of the other. Instead, it is argued that nature and agriculture can, and should, work together and ultimately benefit from one another. Chapters describe efforts to protect nature through globally connected protected area systems and illustrate how farming methods are being shaped to protect nature within agricultural systems. The authors also point to many ways in which nature benefits agriculture through the ecosystem services it provides. Overall, the book shows that nature conservation and food production must be considered as equally important components of future solutions to meet the global demand for food in a manner that is sustainable for both the human population and the planet as a whole.

Aquatic plants refer to a diverse group of aquatic photosynthetic organisms large enough to be seen with the naked eye, and the vegetative parts of which actively grow either permanently or periodically (for at least several weeks each year) submerged below, floating on, or growing up through the water surface. These include aquatic vascular plants, aquatic mosses and some larger algae. Aquatic plants are grouped into life forms, each of which relates differently to limiting factors and has distinct ecological functions in aquatic ecosystems. Life form groups include emergent macrophytes (plants that are rooted in sediment or soils that are periodically inundated, with all other structures extending into the air), floating-leaved macrophytes (rooted plants with leaves that float on the water surface), submersed macrophytes (rooted plants growing completely submerged), free submerged macrophytes (which are not rooted but attached to other macrophytes or submerged structures) and free-floating macrophytes (plants that float on the water surface). Aquatic plants play an important role in the structure and function of aquatic ecosystems by altering water movement regimes, providing shelter and refuge and serving as a food source. In addition, aquatic plants produce large standing crops which can also stabilize sediments, accumulate large amounts of nutrients thus improving water healthy. Thus, because of their ecological role, aquatic plants are an important component of aquatic ecosystems. Aquatic plants are very vulnerable to human activities and global changes, and many species of the plants had become endangered in the past several decades due to habitat loss, flooding, damming, over foraging, biological invasion and eutrophication, which might not be halted but enforced in the future when more extreme weathers coincide with enhanced human activities.

"This book is full of recipes that are good to eat and good for the earth. Check it out." -Ellen DeGeneres In Food Is the Solution, Matthew Prescott, Senior Food Policy Director for the Humane Society and a leader in the environmental food movement, shows how our plates have the power to heal the world. This lavishly designed resource and recipe collection shows how anyone can help solve the world's major issues—environmental problems chief among them—simply by incorporating more plants into their diets. Featuring investigative reporting, compelling infographics, and essays from notable contributors like Dr. Michael Greger, John Mackey, James Cameron, Paul McCartney, and Wolfgang Puck, Food Is the Solution will inspire us all to put more plants on our plates. What we eat will determine what kind of world we live in and what kind of world we live on—and Matthew Prescott proves that meat-heavy diets are destroying the planet. Imagine a world in which we are all healthier. Imagine a world where the air is clean, forests dense, water pure, and animal life healthy. That world is a happier world, a better world—and the delectable plant-based foods Prescott shows us how to prepare in Food Is the Solution will help us create it.

This book offers an overview of salt stress, which has a devastating effect on the yields of various agricultural crops around the globe. Excessive salts in soil reduce the availability of water, inhibit metabolic processes, and affect nutrient composition, osmotic balance, and hydraulic conductivity. Plants have developed a number of tolerance mechanisms, such as various compatible solutes, polyamines, reactive oxygen species and antioxidant defense mechanisms, ion transport and compartmentalization of injurious ions. The exploitation of genetic variation, use of plant hormones, mineral nutrients, soil microbe interactions, and other mechanical practices are of prime importance in agriculture, and as such have been the subject of multidisciplinary

research. Covering both theoretical and practical aspects, the book provides essential physiological, ecological, biochemical, environmental and molecular information as well as perspectives for future research. It is a valuable resource for students, teachers and researchers and anyone interested in agronomy, ecology, stress physiology, environmental science, crop science and molecular biology.
