This book is the product of more than half a century of leadership and innovation in physics education. When the first edition of University Physics by Francis W. Sears and Mark W. Zemansky was published in 1949, it was revolutionary among calculus-based physics textbooks in its emphasis on the fundamental principles of physics and how to apply them. The success of University Physics with generations of (several million) students and educators around the world is a testament to the merits of this approach and to the many innovations it has introduced subsequently. In preparing this First Australian SI edition, our aim was to create a text that is the future of Physics Education in Australia. We have further enhanced and developed University Physics to assimilate the best ideas from education research with enhanced problem-solving instruction, pioneering visual and conceptual pedagogy, the first systematically enhanced problems, and the most pedagogically proven and widely used online homework and tutorial system in the world, Mastering Physics.

Jong and Rogers have written an in depth text covering various topics of the first courses in statics and dynamics offered in the sophomore and junior year of engineering colleges. Students are assumed to have a background in algebra, geometry, trigonometry, and basic differential and integral calculus. Students with prior knowledge of college physics will have an added advantage for learning statics and dynamics. Mechanics has long been recognized as a deductive science. However, the learning process is largely inductive. In the text, simple topics and problems precede those that are more complex and advanced. The text is written to provide a clear and up-to-date presentation of the theory and application of engineering mechanics; It is aimed at

helping engineering students develop an ability to apply well-established principles to analyze and solve problems in a logical and effective manner.
