Jordan collects various answering machine messages people leave on their phones. She claims that answering machine messages fulfill one of Bascom's folkloric functions -- education -- by intentionally or unintentionally teaching us something about the person who owns the phone. Jordan especially focuses on the prevalence of strange machine messages left by young children and college freshman. She believes that message machines are subversive insofar as they allow a person

to say things that they could not say in other social situations. Jordan proposes that answering machines fulfill the folkloric element of social control by allowing the message creator to create a phone persona that reflects the way that person would like to be known.

Telephone conversations are unusual in several ways: messages must travel a distance, communication is based only in sound (where face to face encounters draw on visual clues), generally conversations occur only in dyads (caller-answerer), the only means of entry to these encounters is a summons-answer sequence (an unusual way for a face to face encounter to begin), and talking is the primary and often the only activity taking place in such an encounter. Telephony splits sounds from other senses, splits the dyad from society, and splits communication from other activities (Hopper 1992:41). McLuban refers to the telephone as the irresistible intruder that ignores the visual privacy provided by cubicles and offices, and any difference in the statuses of the caller and answerer (1995 :271). Identification and recognition of the interactants' names and identities form an important part of telephone conversations; names particularly play a role in the opening of most telephone conversations. The name of the target individual is the telemarketer's key to entering into an interaction, for instance.

"Professional callers identify a stranger-answerer by name and then launch inquiries that simulate acquaintance. The goal is to keep a potential consumer on the line against

her will." (Hopper 1992:208) This relates to McLuhan's assertion that "in a visual and highly literate culture when we meet a person for the first time his visual appearance dims the sound of his name. Whereas in an ear culture the sound of the man's name is the overwhelming fact." (1995:31) In a telephone conversation, the name's sound holds great significance. Perhaps the telephone is supporting McLuhan's proposed societal shift from hot to cool; on the other hand, in a normal telephone interaction, there is not visual information available, and so the sound must become the most important aspect of the conversation. As this example shows, the telephone as a medium raises some interesting questions about the nature of interaction. It also has implications for how an interaction will proceed. One technology associated with the telephone that has become increasingly inescapable in American society is the answering machine. While researchers in conversational analysis have used recordings of telephone conversations to explore rules of conversation, so far they have not paid much attention to answering machines. This may be because an answering machine message is not clearly a part of conversation. In a telephone conversation the caller and an answerer participate in an exchange. An answering machine allows the answerer to make the same statement to every individual who calls, and provides time for any caller to deliver a single response. The telephone allows people at a distance to communicate; the answering machine allows busy people to communicate without coordinating an encounter. An answering machine is a medium for people to exchange information, to conduct business, and to plan and coordinate future interactions, face to face or otherwise. The answering machine, and related technology such as voice mail, has become a ubiquitous means of interacting with other people. It would make sense, then, for scholars to fit answering machine messages into the larger body of conversation theory. How does the answering

machine fit into our underlying the idea of orderly communication? When construction of I began considering talk (Firth 1995a: that question, I ISS). To explore had to think about how answering machine messages might fit into study answering machine messages, conversation, I and fit them into an existing body of commonly studied theory about aspects of talk conversation. such as error Conversation analysis was the routines, speech best way to pursue acts, and turn answers. Funny and unique messages are especially common in America among college students. All messages have the same purpose and follow a basic pattern, but the variations make them interesting to listen to. These messages serve as a way to educate, escape

society's limits, and maintain social control. Beginning with a primer on basic statistics, the first half of the book takes readers on a comprehensive tour through the basics of survey design. Topics covered include the ethics of surveys, the design of survey procedures, the design of the survey instrument, how to write questions and how to draw representative samples. Having shown readers how to design surveys, the second half of the book discusses a number of issues surrounding their implementation, including repetitive surveys, the economics of surveys, web-based surveys, coding and data entry, data expansion and weighting, the issue

of non-response, and the documenting and archiving of survey data. The book is an excellent introduction to the use of surveys for graduate students as well as a useful reference work for scholars and professionals.

When he emerged he had under his arm a manuscript, a genre-smashing book about comedy, tragedy, love, loss, war, and redemption. When asked if this was the celebrity memoir, Norm replied, "Call it anything you damn like."
