When first they meet, Neil and Zach discovered a sexual and emotional chemistry that could not be denied. Then, as mental illness consumes one, each must grow, repair himself, and work to become stronger and more independent to ultimately conquer the life-crushing consequences wrought by mental illness and emotional dependency. Chemistry is the story of attraction between lovers, the brain chemistry that determines personality and mood, the medications needed for regaining mental health, and the relationships between people who care for one another. DeSimone debut is an enthralling novel of courage, liberation, and self-realization.

**A Weekly Journal of Literature, Science, and the Fine Arts** John Wiley & Sons

This is not a history of chemistry which uses stamps instead of the usual illustrations, but a collection of short essays and comments on such chemistry as can be found on postage stamps and other philatelic items. In other words, the choice of topics is dictated by the philatelic material available, with the necessary consequence that important parts of chemical history will be missing for the simple reason that they have not found their way onto postage stamps. Thus, the reader may find detailed comments on lesser known chemists, such as Wilhelm August Lampadius who has been honoured with two stamps by the German Post Office, but hardly anything on such luminaries as Robert Bunsen, who have not been deemed worthy of a commemorative issue.

Many scientists and engineers consider themselves poor writers or find the writing process difficult. The good news is that you do not have to be a talented writer to produce a good scientific paper, but you do have to be a careful writer. In particular, writing for a peer-reviewed scientific or engineering journal requires learning and executing a specific formula for presenting scientific work. This book is all about teaching the style and conventions of writing for a peer-reviewed scientific journal. From structure to style, titles to tables, abstracts to author lists, this book gives practical advice about the process of writing a paper and getting it published.

**Nothing: A Very Short Introduction Modern Chemistry**

What did California look like before Hollywood? Before the Gold Rush? Before the missions? Brian Fagan, the best known popular archaeology writer in America, is your tour guide on a fascinating trip across the Golden State before the arrival of Europeans. Fagan tells of the first groups who drifted into the state over 13,000 years ago and how their descendants used the land and sea to survive in a fragile environment subject to earthquake, drought, and flood. On your tour, you will visit the shellmounds of San Francisco Bay, salmon trappers of the northern streams, acorn gatherers of the Central Valley, Chumash villages on the Santa Barbara coast, and shamans who painted mysterious figures on stone. Fagan shows how archaeologists scientifically reconstruct this lost history from fragments of bone, shell, and stone, from travellers' and scholars' descriptions of vanished peoples, and from the stories told by the tribal members themselves. Join a famous archaeologist on this captivating journey and find out what important lessons this story has for California's future.

An exploration of the concept of "nothing" journeys from ancient ideas and cultural traditions to the latest scientific research, discussing the history of the vacuum, theories on the nature of time and space, and other discoveries.

Modern Inorganic Chemistry Rowman Altamira

From New York Times bestselling author Sam Kean comes incredible stories of science, history, finance, mythology, the arts, medicine, and more, as told by the Periodic Table. Why did Gandhi hate iodine (I, 53)? How did radium (Ra, 88) nearly ruin Marie Curie's reputation? And why is gallium (Ga, 31) the go-to element for laboratory pranksters? The Periodic Table is a crowning scientific achievement, but it's also a treasure trove of adventure, betrayal, and obsession. These fascinating tales follow every element on the table as they play out their parts in human history, and in the lives of the (frequently) mad scientists who discovered them. THE DISAPPEARING SPOON masterfully fuses science with the classic lore of invention, investigation, and discovery--from the Big Bang through the end of time. \*Though solid at room temperature, gallium is a moldable metal that melts at 84 degrees Fahrenheit. A classic science prank is to mold gallium spoons, serve them with tea, and watch guests recoil as their utensils disappear.

An Archaeologist Looks at Our Earliest Inhabitants OUP Oxford

Historical analysis reveals that perceptual theories and models are doomed to relatively short lives. The most popular contemporary theories in perceptual science do not have as wide an acceptance among researchers as do some of those in other sciences. To understand these difficulties, the authors of the present volume explore the conceptual and philosophical foundations of perceptual science. Based on logical analyses of various problems, theories, and models, they offer a number of reasons for the current weakness of perceptual explanations. New theoretical approaches are also proposed. At the end of each chapter, dicussants contribute to the conclusions by critically examining the authors' ideas and analyses.

Modern Political Economy Marcel Dekker

What is 'the void'? What remains when you take all the matter away? Can empty space - 'nothing' - exist? This little book explores the science and the history of the elusive void: from Aristotle who insisted that the vacuum was impossible, via the theories of Newton and Einstein, to our very latest discoveries and why they can tell us extraordinary things about the cosmos. Frank Close tells the story of how scientists have explored the elusive void, and the rich discoveries that they have made there. He takes the reader on a lively and accessible history through ancient ideas and cultural superstitions to the frontiers of current research. He describes how scientists discovered that the vacuum is filled with fields; how Newton, Mach, and Einstein grappled with the nature of space and time; and how the mysterious 'aether' that was long ago supposed to permeate the void may now be making a comeback with the latest research into the 'Higgs field'. We now know that the vacuum is far from being 'nothing' - it seethes with virtual particles and antiparticles that erupt spontaneously into being, and it also may contain hidden dimensions that we were previously unaware of. These new discoveries may provide answers to some of cosmology's most fundamental questions: what lies outside the universe, and, if there was once nothing, then how did the universe begin?
