Inequalities and Functions with the related ways of solutions Many exercises the reader can do for each different argument with related explanations and solutions Algebra is a very noteworthy subfield of mathematics in its versatility alone if nothing else. You will be hard-pressed to find one single area of mathematics that is taught after algebra in which algebra is not practiced in almost every situation. The most general and the most commonly used definition of algebra is the study of mathematical symbols as well as the study of the manipulation of these symbols. Mathematical symbols are one of the most basic elements of mathematics, aside from numbers themselves and operation symbols, so the study of these symbols is one of the most important studies that one can take up as far as mathematics is concerned. To that end, in this book, you will find some of the most important topics regarding algebra. These include but are not limited to the following: understanding integers and basic operations, inequalities and one-step operations; fractions and factors; the main rules of arithmetic; linear equations in the coordinate plane, expressions, equations and functions; real numbers; solving linear equations; visualizing linear functions, linear equations, linear inequalities, systems of linear equations and inequalities; exponents and exponential function; polynomials, quadratic equations, radical expression, radical equations, rational expressions; and finally, intermediate topics in algebra.

CONCEPT: This algebra workbook has a creative twist: A picture of a Cuddly Bear is used in place of a boring old X for the unknown. The idea behind adding this artistic touch to the equations is to help make algebra seem a little more fun and enjoyable. Students don't need to draw bears in their solutions, though - they can write X if they want. However, there is an opportunity for students to be creative - for example, they could draw smiley faces instead of X's.

INSTRUCTION: The staff at Al-Bear Einstein developed a concise, one-

page introduction to each chapter that explains what to do in simple terms and provides an instructive example to serve as a guide. The description emphasizes the underlying concept, like dividing both sides by the same number. The material is presented in stages: A new technique is introduced in each stage, allowing students to focus on and master one idea at a time. Review sections help to reinforce the older material and force students to learn when to apply the various techniques. The Cuddly Bears drawn by artist Bearlyn help to engage student interest and make the learning process fun.

STRUCTURE: This workbook offers plenty of practice applying basic algebra skills to solve equations.

The problems start out simple, like without distracting complications. $X + 4 = 12$, and progressively advance, culminating in equations like $3X + 8 = 9X - 16$ (but with Cuddly Bears instead of X's). The problems are written in a large font. ANSWERS: Teachers or parents can check the answers at the end of the workbook. LEVEL. This workbook focuses on basic algebra skills. No prior experience with algebra is needed. The goal is to learn how to solve for one unknown in a linear equation using basic arithmetic operations. All of the answers are positive integers. There are no fractions. All of the problems can be solved without a calculator with elementary arithmetic with the numbers 1 thru 9. This way, students can focus on the main idea

CONTENTS: The stages of this workbook are presented as follows: This workbook begins with simple equations that can be solved with a single arithmetic operation, like adding a constant to both sides. Each of the first four sections focuses on a different operation. This allows students to master one technique at a time. A review section mixes the four operations together. The next section combines operations together. For example, it may be necessary to first subtract a number from both sides and then divide both sides by a number. Students next learn how to add the unknown to both sides of the equation in order to solve the problem. The last section offers

ample practice with equations of the form $3X + 8 = 23 - 2X$. Students must add or subtract both constants and unknowns to/from both sides of the equation in order to solve these problems.

If students adhere to this process diligently, they should develop confidence in their abilities to solve the types of single variable linear equations. HOW TO USE THIS WORKBOOK As students work their way through the different types of equations in this workbook, they may find some of the equations a bit of a challenge to solve. This is intentional so students get practice in solving various complex problems. If they get stuck on a problem, they can take a quick look at the solutions for the next step in how to proceed. Then, they should go back to the problem and keep working on it until it's finished. Afterwards, they should check their work and answer. If students can do the majority of these challenging problems correctly on their own, they can feel a sense of accomplishment knowing that they solved difficult problems. Note: These problems
