Answers about Chemical Equations

Chemical equations are used to show chemical reactions. Chemical equations are typically written using the chemical formulas for the reactants and products. Chemical equations use an arrow to separate the two sides of the equation. Chemical equations are always written out in words.

Chemical Reactions and Equations - Chemistry | Socratic

4) Multiply through by two for the final answer:

Comment: one way to look at this is that using the 3 / 2 was just a mathematical artifice to balance the equation. The chemical reality of atoms reacting in ratios of small whole numbers is reflected in the final answer.

This is a HUGE question to answer completely! One answer is 'because they result in a negative change in free energy, delta-G.' This may be as a result of the reaction being exothermic, so the products are more stable than the reactants, or could be a result of an increase in entropy (products more disordered than the reactants), or both of these.

How to Balance Equations - Printable Worksheets
A balanced chemical equation gives the number and type of atoms participating in a reaction, the reactants, products, and direction of the reaction. Balancing an unbalanced equation is mostly a matter of making certain mass and charge are balanced on the reactants and products side of the reaction arrow.

The chemical equation has the products on the right side, while the reactants are written on the left side. Both of them are separated by an arrow. For instance, $2\text{H}_2 + \text{O}_2 \rightarrow 2\text{H}_2\text{O}$ denotes that there are four atoms of hydrogen and 2 atoms of oxygen on both sides of the equation.
