The increased and widespread availability of large network data resources in recent years has resulted in a growing need for effective methods for their analysis. The challenge is to detect patterns that provide a better understanding of the data. However, this is not a straightforward task because of the size of the data sets and the computer power required for the analysis. The solution is to devise methods for approximately answering the questions posed, and these methods will vary depending on the data sets under scrutiny. This cutting-edge text introduces biological concepts and biotechnologies producing the data, graph and network theory, cluster analysis and machine learning, before discussing the thought processes and creativity involved in the analysis of large-scale biological and medical data sets, using a wide range of real-life examples. Bringing together leading experts, this text provides an ideal introduction to and insight into the interdisciplinary field of network data analysis in biomedicine.

It draws on comprehensive data resulting from a Leverhulme Trust research study focused on Africa, and a study funded by the British Academy focused on India, which explored the way in which global actors and organisations bring policy ideas to bear and are joined up in a global education policy network.

This timely and cutting-edge new work develops concepts, analyses and methods deployed in Education Plc (2008), Networks, New Governance and Education (2012) and Global Education Inc. (2012). The research is framed by an elaboration of Network Ethnography, an innovative method of policy research. Edu.net presents the substantive findings of the authors' research by focusing on various kinds of policy movement - people, ideas, practices, methods, money. The book is about both global education policy and ways of researching policy in a global setting. It is an essential read for policy analysts, educational academic researchers and postgraduate education students

alike.
