There is no problem more baffling to the academic world than the problem of consciousness. It's fair to say that no academic has any clue at all about what consciousness is. In fact, academics have totally confused it with something radically different, namely sentience. The problem that faces the academic world is the insurmountable one of how you get lifeless, mindless, purposeless objects (material atoms) to manifest subjectivity. It's a category error to imagine that matter can provide any answers to the foundational issues of mind. Academics believe that to answer the problem of subjectivity is thereby to solve the "hard problem" of consciousness. In fact, the problem of subjectivity (sentience) is totally different from the problem of consciousness. To understand why, simply ponder all of the following statements: 1) animals are sentient but not conscious; 2) human babies are sentient but not conscious; 3) humans who never encountered another human are sentient but not conscious; 4) sleepwalking humans are sentient but not conscious. The problem of sentience is drastically different from the problem of consciousness and if you conflate the two you have immediately set yourself an impossible task, especially if you make any attempt to solve these problems within the framework of materialism (i.e., the ideology of anti-mind). To understand what consciousness actually is, it's essential to understand the difference, in the world of sleep, between dreaming and lucid dreaming. Exactly the same dichotomy is present in the waking world. A sleepwalker is a person who can do complex tasks — such as riding a motorbike for half an hour — without any consciousness. A conscious version of a sleepwalker engages in what we refer to as "lucid waking". Lucid waking is the key to consciousness. The fact is that consciousness is not an inherent property of human individuals. It's not built into them. It's acquired, just as some people acquire the ability to become lucid dreamers. Since sleepwalkers could do many of the same things as conscious individuals, the question is invited of why consciousness is required at all. If you don't know what consciousness is, how can you expand your consciousness to the maximum? Wouldn't you like to be maximally conscious? Think of the power you would have.

Despite decades of research, poisonous plants continue to be responsible for large economic losses to livestock producers throughout the world. As the expansion into rural areas and the use of rangelands increases, an understanding of plant toxicology has become ever more important. This book represents the product of a wide-range of research aimed at solving the various issues surrounding poisonous plants. Broader themes include plant biochemistry, toxic effects in animals and humans, and rangeland management approaches to prevent poisoning amongst others. Individual chapters address plant animal relationships, various classes of secondary plant compounds, isolation, identification and effects of these toxins on biological mammalian systems and analytical methods, diagnostic tools and management strategies for plant toxicoses in animals and humans.

Mary Siisip Geniusz has spent more than thirty years working with, living with, and using the Anishinaabe teachings, recipes, and botanical information she shares in *Plants Have So Much to Give Us, All We Have to Do Is Ask*. Geniusz gained much of the knowledge she writes about from her years as an oshkaabewis, a traditionally trained apprentice, and as friend to the late Keewaydinoquay, an Anishinaabe medicine woman from the Leelanau Peninsula in Michigan and a scholar, teacher, and practitioner in the field of native ethnobotany. Keewaydinoquay published little in her lifetime, yet Geniusz has carried on her legacy by making this body of knowledge accessible to a broader audience. Geniusz teaches the ways she was taught—through stories. Sharing the traditional stories she learned at Keewaydinoquay's side as well as stories from other American Indian traditions and her own experiences, Geniusz brings the plants to life with narratives that explain their uses, meaning, and history. Stories such as "Naanabozho and the Squeaky-Voice Plant" place the plants in cultural context and illustrate the belief in plants as cognizant beings. Covering a wide range of plants, from conifers to cattails to medicinal uses of yarrow, mullein, and dandelion, she explains how we can work with those beings to create food, simple medicines, and practical botanical tools. *Plants Have So Much to Give Us, All We Have to Do Is Ask* makes this botanical information useful to native and nonnative healers and educators and places it in the context of the Anishinaabe culture that developed the knowledge and practice.
