From ensorcelled princesses to a frog that speaks, an enchanting collection of fairy tales from the Newbery Medal – winning author. The last mortal kingdom before the unmeasured sweep of Faerieland begins has at best held an uneasy truce with its unpredictable neighbor. There is nothing to show a boundary, at least on the mortal side of it; and if any ordinary human creature ever saw a faerie—or at any rate recognized one—it was never mentioned; but the existence of the boundary and of faeries beyond it is never in doubt either. So begins “The Stolen Princess,” the first story of this collection, about the meeting between the human princess Linadel and the faerie prince Donathor. “The Princess and the Frog” concerns Rana and her unexpected alliance with a small, green, flipper-footed denizen of a pond in the palace gardens. “The Hunting of the Hind” tells of a princess who has bewitched her beloved brother, hoping to beg some magic of cure, for her brother is dying, and the last tale is a retelling of the Twelve Dancing Princesses in which an old soldier discovers, with a little help from a lavender-eyed witch, the surprising truth about where the princesses dance their shoes to tatters every night.

Knowledge is a big subject, says Stuart Firestein, but ignorance is a bigger one. And it is ignorance—not knowledge—that is the true engine of science. Most of us have a false impression of science as a surefire, deliberate, step-by-step method for finding things out and getting things done. In fact, says Firestein, more often than not, science is like looking for a black cat in a dark room, and there may not be a cat in the room. The process is more hit-or-miss than you might imagine, with much stumbling and groping after phantoms. But it is exactly this “not knowing,” this puzzling over thorny questions or inexplicable data, that gets researchers into the lab early and keeps them there late, the thing that propels them, the very driving force of science. Firestein shows how scientists use ignorance to program their work, to identify what should be done, what the next steps are, and where they should concentrate their energies. And he includes a catalog of how scientists use ignorance, consciously or unconsciously—a remarkable range of approaches that includes looking for connections to other research, revisiting apparently settled questions, using small questions to get at big ones, and tackling a problem simply out of curiosity. The book concludes with four case histories—in cognitive psychology, theoretical physics, astronomy, and neuroscience—that provide a feel for the nuts and bolts of ignorance, the day-to-day battle that goes on in scientific laboratories and in scientific minds with questions that range from the quotidian to the profound. Turning the conventional idea about science on its head, Ignorance opens a new window on the true nature of research. It is a must-read for anyone curious about science.

Should teenagers have jobs while they're in high school? Doesn't working distract them from schoolwork, cause long-term problem behaviors, and precipitate a precocious transition to adulthood? This report from a remarkable longitudinal study of 1,000 students, followed from the beginning of high school through their mid-twenties, answers, resoundingly, no. Examining a broad range of teenagers, Jeylan Mortimer concludes that high school students who work even as much as half-time are in fact better off in many ways than students who don't have jobs at all. Having part-time jobs can increase confidence and time management skills, promote vocational exploration, and enhance subsequent academic success. The wider social circle of adults they meet through their jobs can also buffer strains at home, and some of what young people learn on

the job—not least responsibility and confidence—gives them an advantage in later work life.

Body by Design defines the basic anatomy and physiology in each of 11 body systems from a creational viewpoint. Every chapter explores the wonder, beauty, and creation of the human body, giving evidence for creation, while exposing faulty evolutionistic reasoning. Special explorations into each body system look closely at disease aspects, current events, and discoveries, while profiling the classic and contemporary scientists and physicians who have made remarkable breakthrough in studies of the different areas of the human body. Body by Design is an ideal textbook for Christians high school or college students. It utilizes tables, graphs, focus sections, diagrams, and illustrations to provide clear examples and explanations of the ideas presented. Questions at the end of each chapter challenge the student to think through the evidence presented.
