Are you an RTL or system

designer that is currently
using, moving, or planning to
move to an HLS design
environment? Finally, a
comprehensive guide for
designing hardware using
C++ is here. Michael
Fingeroff's High-Level
Synthesis Blue Book presents
the most effective C++
synthesis coding style for
achieving high quality RTL.
Master a totally new design
methodology for coding
increasingly complex
designs! This book provides
a step-by-step approach to
using C++ as a hardware
design language, including an
introduction to the basics of
HLS using concepts familiar
to RTL designers. Each
chapter provides easy-to-
understand C++ examples,
along with hardware and
timing diagrams where
appropriate. The book
progresses from simple

concepts such as sequential logic design to more complicated topics such as memory architecture and hierarchical sub-system design. Later chapters bring together many of the earlier HLS design concepts through their application in simplified design examples. These examples illustrate the fundamental principles behind C++ hardware design, which will translate to much larger designs. Although this book focuses primarily on C and C++ to present the basics of C++ synthesis, all of the concepts are equally applicable to SystemC when describing the core algorithmic part of a design. On completion of this book, readers should be well on their way to becoming experts in high-level synthesis.

Peterson's Master the SSAT & ISEE contains hundreds of practice questions, solid test-taking advice, and essential private secondary school information. Test-takers can use Peterson's ebook to obtain their best

high school entrance exam score and get into the secondary school of their choice. Readers will find sections on high school entrance exam basics, vocabulary review, verbal ability review, reading review, mathematics review, writing sample review, SSAT and ISEE practice tests, and a Parent's Guide to Private Schools. Peterson's Master the SSAT & ISEE provides students with detailed strategies to help maximize their test scores AND assists parents with guidance on selecting, applying to, and paying for private school. Lantern Books

The series is specially designed for students from intermediate to proficiency level. Each book consists of five modules and provides systematic preparation in all four language skills - listening, speaking, reading and writing - required at these levels. The Student's Book and the Workbook are designed to be covered in approximately 100 to

120 hours of classroom work.

This book presents and
discusses new
developments in the
area of turbulence
modelling and
measurements, with
particular emphasis on
engineering-related
problems. At present,
turbulence is one of
the key issues in
tackling engineering
flow problems.
Powerful computers and
numerical methods are
now available for
solving the flow
equations, but the
simulation of
turbulence effects
which are nearly
always important in
practice, is still in
an unsatisfactory
state and introduces
considerable
uncertainties in the
accuracy of CFD
calculations. These
and other aspects of

turbulence modelling
and measurements are
dealt with in detail by
experts in the field.
The resulting book is

Statistics and
Probability for
Engineering
Applications provides
a complete discussion
of all the major
topics typically
covered in a college
engineering statistics
course. This textbook
minimizes the
derivations and
mathematical theory,
focusing instead on
the information and
techniques most needed
and used in
engineering
applications. It is
filled with practical
techniques directly
applicable on the job.
Written by an
experienced industry
engineer and
statistics professor,
this book makes
learning statistical
methods easier for
today's student. This
book can be read
sequentially like a
normal textbook, but
it is designed to be
used as a handbook,
pointing the reader to
the topics and

sections pertinent to a particular type of statistical problem. Each new concept is clearly and briefly described, whenever possible by relating it to previous topics. Then the student is given carefully chosen examples to deepen understanding of the basic ideas and how they are applied in engineering. The examples and case studies are taken from real-world engineering problems and use real data. A number of practice problems are provided for each section, with answers in the back for selected problems. This book will appeal to engineers in the entire engineering spectrum (electronics/electrical, mechanical, chemical, and civil engineering); engineering students and students taking computer science/computer engineering graduate courses; scientists needing to use applied statistical methods; and engineering technicians and technologists. * Filled with practical techniques directly applicable on the job * Contains hundreds of solved problems and case studies, using real data sets * Avoids

unnecessary theory *Bulletin of the JSME*. The second edition of this quick reference handbook for obstetricians and gynecologists and primary care physicians is designed to complement the parent textbook *Clinical Obstetrics: The Fetus & Mother*. The third edition of *Clinical Obstetrics: The Fetus & Mother* is unique in that it gives in-depth attention to the two patients - fetus and mother, with special coverage of each patient. *Clinical Obstetrics* thoroughly reviews the biology, pathology, and clinical management of disorders affecting both the fetus and the mother. *Clinical Obstetrics: The Fetus & Mother - Handbook* provides the practising physician with succinct, clinically focused information in an easily retrievable format that facilitates diagnosis, evaluation, and treatment. When you need fast answers to

specific questions, you can turn with confidence to this streamlined, updated reference. Winter Annual Meeting IPCC Report on sources, capture, transport, and storage of CO₂, for researchers, policy-makers and engineers. **Handbook of Clinical Obstetrics** This volume is the proceedings of the Workshop on Optimal Design and Control that was held in Blacksburg, Virginia, April 8-9, 1994. The workshop was sponsored by the Air Force Office of Scientific Research through the Air Force Center for Optimal Design and Control (CODAC) at Virginia Tech. The workshop was a gathering of engineers and mathematicians actively involved in innovative research in control and optimization, with emphasis placed on problems governed by partial differential equations. The interdisciplinary nature of the workshop and the wide range of subdisciplines represented by the participants enabled an exchange of valuable information

and also led to significant discussions about multidisciplinary optimization issues. One of the goals of the work shop was to include laboratory, industrial, and academic researchers so that analyses, algorithms, implementations, and applications could all be well-represented in the talks; this interdisciplinary nature is reflected in these proceedings. An overriding impression that can be gleaned from the papers in this volume is the complexity of problems addressed by not only those authors engaged in applications, but also by those engaged in algorithmic development and even mathematical analyses. Thus, in many instances, systematic approaches using fully nonlinear constraint equations are routinely used to solve control and optimization problems, in some cases replacing ad-hoc or empirically based procedures.
