Thermal Analysis | ANSYS

In thermal transient analysis, time-dependent values of the bulk temperature and convection coefficients must be described as functions of time. In the ANSYS finite element analysis program, Table Arrays are often employed to describe these time-dependent functions. This "tips & tricks" article presents a simple example of such a procedure.

This tutorial was created using ANSYS 7.0 The purpose of this tutorial is to show the steps involved to perform a simple transient analysis. Transient dynamic analysis is a technique used to determine the dynamic response of a structure under a time-varying load. The time frame for this type of analysis is such that inertia or damping effects of the structure are considered to be important.

This tutorial was created using ANSYS 7.0 to solve a simple transient conduction problem. Special thanks to Jesse Arnold for the analytical solution shown at the end of the tutorial. The example is constrained as shown in the following figure. Thermal conductivity (k) of the material is 5 W/m*K and the block is assumed to be infinitely long.
