This book gathers the proceedings of the 2017 DepCoS-RELCOMEX, an annual conference series that has been organized by the Department of Computer Engineering at the Faculty of Electronics, Wroc ł aw University of Science and Technology, since 2006. Its mission is to continue the heritage of the other two cycles of events – the RELCOMEX conferences (1977 – 89) and Microcomputer Schools (1985 – 95) – so this year we can celebrate the 40th anniversary of its origins. In contrast to those preceding series, which were focused on conventional reliability analysis, the goal of DepCoS is to promote a more comprehensive approach to system performability, which is now commonly called dependability. This innovative research area provides answers to the latest challenges in reliability evaluation for contemporary complex systems. Its novelty is based on a multi-disciplinary approach to system theory, technology and maintenance of systems operating in real environments. Dependability analyses concentrate on the efficient completion of tasks, services and jobs by a system considered as a combination of technical, information and human assets, in contrast to “ classical ” reliability, which is generally limited to the analysis of technical resources and associated components and structures. The selection of papers for this volume illustrates the diversity of topics that need to be considered, from mathematical models and design methodologies through software engineering and data security issues, to practical engineering problems in technical systems. In addition, this edition of the conference hosted the 7th CrISS-DESSERT Workshop, which was devoted to the analysis and assurance of safety and cyber security in critical infrastructure and computer systems.

With the advent of the Safe Drinking Water Act Amendments of 1986, many water utilities are reexamining their water treatment practices. Upcoming new regulations on disinfection and on disinfection by-products, in particular, are the primary driving forces for the big interest in ozone. It appears that ozone, with its strong disinfection capabilities, and apparently lower levels of disinfection by-products (compared to other disinfectants), may be the oxidant/disinfectant of choice. Many utilities currently using chlorine for oxidation may need to switch due to chlorine by-product concerns. Utilities using chloramines may need to use ozone to meet CT requirements. This book, prepared by 35 international experts, includes current technology on the design, operation, and control of the ozone process within a drinking water plant. It combines almost 100 years of European ozone design and operating experience

with North American design/operations experience and the North American regulatory and utility operational environment.

Topics covered include ozone chemistry, toxicology, design consideration, engineering aspects, design of retrofit systems, and the operation and economics of ozone technology. The book contains a "how to" section on ozone treatability studies, which explains what information can be learned using treatability studies, at what scale (bench, pilot, or demonstration plant), and how this information can be used to design full-scale systems. It also includes valuable tips regarding important operating practices, as well as guidance on retrofits and the unique issues involved with retrofitting the ozone process. With ozone being one of the hottest areas of interest in drinking water, this book will prove essential to all water utilities, design engineers, regulators, and plant managers and supervisors.

Leadership is still much discussed, studied, and sought after, even though we now live in supposedly more democratic times with flatter organizations and empowered employees. But how can we best understand leadership? Are leaders born or made? Do they have particular traits or are we all potential leaders? Do the requirements for leadership change over time or are there timeless patterns? Do traditional approaches help us to pick and develop leaders or are there alternative ways that advance our understanding? In this book, Keith Grint, who has been studying and teaching leadership for over a decade, investigates the notion of leadership in a series of historical case studies and rich essay portraits of some of the most famous, and infamous, leaders (e.g. Florence Nightingale, Richard Branson, Horatio Nelson, Martin Luther King, Henry Ford, etc.). The scenarios are drawn from right across the spectrum to include business, politics, society, and the military. The first part of the book considers four sets of parallel cases where leadership appears to be a major explanation of success and failure. The second part takes the four critical issues arising from these parallel cases (identity, strategic vision, organizational tactics, and persuasive communication) and explores them in detail. One main reason we have such difficulty in explaining and enhancing leadership, Grint argues, is because we

often adopt perspectives and models that obscure rather than illuminate the issues involved. The reliance upon traditional scientific analysis has not provided the anticipated advances in our understanding because leadership is more fruitfully considered as an art, or more exactly an array of arts, rather than as a science. Grint's rich and meticulously-researched profiles combine to reveal these Arts of Leadership.
