Iteration statements change the flow of control by repeating a set of statements zero or more times until a condition is met. If the boolean expression evaluates to false initially, the loop body is not executed at all. There are three parts in a for loop header: the initialization, the boolean expression, and the increment.

Created by Pamela Fox. In programming, we use lists to store sequences of related data. We often want to perform the same operation on every element in a list, like displaying each element or manipulating them mathematically. To do that, we can use a loop to iterate over each element, repeating the same code for each element.

Breaking Down the For Loop. A for loop can be divided into three major parts. The first part initializes the loop variable, the second part tests some condition, and the third part increments or decrements the loop variable. Each part of the for loop is separated by a semicolon (;). Let's break down the following example into its three major parts:
