The WHO Guidelines on Hand Hygiene in Health Care provide health-care workers (HCWs), hospital administrators and health authorities with a thorough review of evidence on hand hygiene in health care and specific recommendations to improve practices and reduce transmission of pathogenic microorganisms to patients and HCWs. The present Guidelines are intended to be implemented in any situation in which health care is delivered either to a patient or to a specific group in a population. Therefore, this concept applies to all settings where health care is permanently or occasionally performed, such as home care by birth attendants. Definitions of health-care settings are proposed in Appendix 1. These Guidelines and the associated WHO Multimodal Hand Hygiene Improvement Strategy and an Implementation Toolkit (<http://www.who.int/gpsc/en/>) are designed to offer health-care facilities in Member States a conceptual framework and practical tools for the application of recommendations in practice at the bedside. While ensuring consistency with the Guidelines recommendations, individual adaptation according to local regulations, settings, needs, and resources is desirable. This extensive review includes in one document sufficient technical information to support training materials and help plan implementation strategies. The document comprises six parts.

The AAMI recommended practice, Comprehensive guide to steam sterilization and sterility assurance in health care facilities, is a breakthrough standard in terms of its scope. AAMI has updated ST79 with the release of ST79:2010/A4:2013. Of particular importance, A4:2013 provides four new figures demonstrating the wrapping of items for steam sterilization and adds an annex focused on Moisture assessment. As of Oct. 25, 2013, purchasers of ST79 will receive ANSI/AAMI ST79:2010 and A1:2010 and A2:2011 and A3:2012 and A4:2014 as a single consolidated document. Among other changes from the 2006 edition of ST79, this revised and expanded second edition of ST79 includes guidance on the use and application of Class 6 emulating indicators, a chemical monitoring device fairly new to the United States. Because ST79 essentially consolidates five AAMI steam sterilization standards (whose content was reviewed and updated to reflect current good practice prior to being incorporated into ST79), it truly is a comprehensive guideline for all steam sterilization activities in healthcare facilities, regardless of the size of the sterilizer or the size of the facility, and provides a resource for all healthcare personnel who use steam for sterilization.

You may not know it, but an innovation has made our world a better place. The use of alcohol-based handrubs protects us from infectious diseases and saves millions of lives each year through safer health care. Here is the story of this revolutionary formulation, made available without patent and offered as a gift to humanity by Professor Didier Pittet and his team at Hôpitaux Universitaires de Genève (HUG). From bush doctors to giant pharmaceutical corporations, everyone can now produce effective handrubs, cheaply and easily. Didier Pittet's medical odyssey has taken him to the four corners of the Earth. It also reveals a new path open to human society, one that pro- mises a radical shift from a predatory economic system to an economy of peace. Thierry Crouzet — blogger, essay writer, and novelist — is fascinated by contemporary issues located at the nexus of technology, politics, and lite- rature. A former journalist, his published works in French include Le Peuple des connecteurs [The Connected People], a reflection on our networked society; J'ai débranché [How I Unplugged], a tale of digital burnout; and La Quatrième Théorie [The Fourth Theory], a political techno-thriller.

Infectious diseases can occur at any stage of life. In children, these may occur in infancy, childhood and adolescence. The diagnosis, treatment and control of pediatric infectious diseases are under the scope of pediatrics. The timely diagnosis and treatment of acute infections are an important focus

of pediatrics. Advancements in medical therapy have resulted in new diagnostics and better therapeutics that have advanced the evaluation, assessment and treatment of infectious diseases. Several diagnostic tests help to ascertain the source of the infection. These may consist of blood cultures, serologic tests, gram staining, genotyping and polymerase chain reaction. In children with chronic infections such as HIV, therapy involves long-term care and assessment. The antimicrobial therapy used to treat an infection depends on the organism that is causing the infections, and accordingly antibiotics, antifungal agents and antiviral agents may be prescribed. This book includes some of the vital pieces of work being conducted across the world, on various topics related to pediatric infections. It provides significant information on pediatric infectious diseases to help develop a good understanding of their prevention and control. The book is appropriate for students seeking detailed information in pediatrics as well as for experts.

**ANSI/AAMI St79: Comprehensive Guide to Steam Sterilization and Sterility Assurance in Health Care Facilities** Springer

Surgical site infections are caused by bacteria that get in through incisions made during surgery. They threaten the lives of millions of patients each year and contribute to the spread of antibiotic resistance. In low- and middle-income countries, 11% of patients who undergo surgery are infected in the process. In Africa, up to 20% of women who have a caesarean section contract a wound infection, compromising their own health and their ability to care for their babies. But surgical site infections are not just a problem for poor countries. In the United States, they contribute to patients spending more than 400 000 extra days in hospital at a cost of an additional US \$10 billion per year. No international evidence-based guidelines had previously been available before WHO launched its global guidelines on the prevention of surgical site infection on 3 November 2016, and there are inconsistencies in the interpretation of evidence and recommendations in existing national guidelines. These new WHO guidelines are valid for any country and suitable to local adaptations, and take account of the strength of available scientific evidence, the cost and resource implications, and patient values and preferences.

These guidelines provide recommendations that outline the critical aspects of infection prevention and control. The recommendations were developed using the best available evidence and consensus methods by the Infection Control Steering Committee. They have been prioritised as key areas to prevent and control infection in a healthcare facility. It is recognised that the level of risk may differ according to the different types of facility and therefore some recommendations should be justified by risk assessment. When implementing these recommendations all healthcare facilities need to consider the risk of transmission of infection and implement according to their specific setting and circumstances.

This Open access book offers updated and revised information on vessel health and preservation (VHP), a model concept first published in poster form in 2008 and in JVA in 2012, which has received a great deal of attention, especially in the US, UK and Australia. The book presents a model and a new way of thinking applied to vascular access and administration of intravenous treatment, and shows how establishing and maintaining a route of access to the bloodstream is essential for patients in acute care today. Until now, little thought has been given to an intentional process to guide selection, insertion and management of vascular access devices (VADs) and by default actions are based on crisis management when a quickly selected VAD fails. The book details how VHP establishes a framework or pathway model for each step of the patient experience, intentionally guiding, improving and eliminating risk when possible. The evidence points to the fact that reducing fragmentation, establishing a pathway, and teaching the process to all stakeholders reduces complications with intravenous therapy, improves efficiency and diminishes cost. As such this book appeals to bedside nurses, physicians and other health professionals.
