Software architecture - Wikipedia

An architectural pattern is a general, reusable solution to a commonly occurring problem in software architecture within a given context.

Architectural patterns are similar to software design pattern but have a broader scope.

The application makes API calls and gathers data once per second, the data is then reflected on the UI in a series of fancy looking widgets. Calling the API from the Main thread once per second was locking up the UI. So this was moved into a BackgroundWorker.

The C4 model is an "abstraction-first" approach to diagramming software architecture, based upon abstractions

that reflect how software architects and developers think about and build software. The small set of abstractions and diagram types makes the C4 model easy to learn and use.

[What is Software Architecture? - Definition from Techopedia](#)

Software architecture is the defining and structuring of a solution that meets technical and operational requirements. Software architecture optimizes attributes involving a series of decisions, such as security, performance and manageability. These decisions ultimately impact application quality, maintenance, performance and overall success.

Case Studies in Software Architecture

The Model-View-Controller (MVC) structure, which is the standard software development approach offered by most of the popular web frameworks, is clearly a layered architecture. Just above the database is the model layer, which often contains business logic and information about the types of data in the database.

The Definition of Software Architecture. In simple words, software architecture is the process of converting software characteristics such as flexibility, scalability, feasibility, reusability, and security into a structured solution that meets the technical and the business expectations. This definition leads us to ask about the characteristics of a software that can affect a software architecture design.

Application Architecture In Software Engineering

Typical application layers. These layers are frequently abbreviated as UI, BLL (Business Logic Layer), and DAL (Data Access Layer). Using this architecture, users make requests through the UI layer, which interacts only with the BLL. The BLL, in turn, can call the DAL for data access requests.

Web application architecture in details Everyone has a basic mental picture of how web application architecture works. Front-end application hits back-end application, which sends the database a request and does business logic whereafter returns a response to a front-end. We strive to take this picture and decompose it into components.

The applications architecture is specified on the basis of business and functional requirements. This involves defining the interaction between application packages, databases, and middleware systems in terms of functional coverage. This helps identify any integration problems or gaps in functional coverage.

The C4 model for visualising software architecture

Requirements of the software should be transformed into an architecture that describes the software 's top-level structure and identifies its components. This is accomplished through architectural design (also called system design), which acts as a preliminary ' blueprint ' from which software can be developed.

Introduction: The software needs the architectural design to represents the design of software.

IEEE defines architectural design as " the process of defining a collection of hardware and software components and their interfaces to establish the framework for the development of a computer system. " . The software that is built for computer-based systems can exhibit one of these many architectural styles.
