The Model-View-Controller (MVC) structure, which is the standard software development approach offered by most of the popular web frameworks, is clearly a layered architecture. Just above the database is the model layer, which often contains business logic and information about the types of data in the database.

[Case Studies in Software Architecture](#)

Typical application layers. These layers are frequently abbreviated as UI, BLL (Business Logic Layer), and DAL (Data Access Layer). Using this architecture, users make requests through the UI layer, which interacts only with the BLL. The BLL, in turn, can call the DAL for data access requests.

*What is Software Architecture? - Definition from Techopedia*

Web application architecture in details Everyone has a basic mental picture of how web application architecture works. Front-end application hits back-end application, which sends the database a request and does business logic whereafter returns a response to a front-end. We strive to take this picture and decompose it into components.

Requirements of the software should be transformed into an architecture that describes the software 's top-level structure and identifies its components. This is accomplished through architectural design (also called system design), which acts as a preliminary ' blueprint ' from which software can be developed.

[The C4 model for visualising software architecture](#)

The C4 model is an "abstraction-first" approach to diagramming software architecture, based upon abstractions that reflect how software architects and developers think about and build software. The small set of abstractions and diagram types makes the C4 model easy to learn and use.

The most common architecture pattern is the layered architecture pattern, otherwise known as the n-tier architecture pattern. This pattern is the de facto standard for most Java EE applications and therefore is widely known by most architects, designers, and developers.

Introduction: The software needs the architectural design to represents the design of software. IEEE defines architectural design as " the process of defining a collection of hardware and software components and their interfaces to establish the framework for the development of a computer system. The applications architecture is specified on the basis of business and functional requirements. This involves defining the interaction between application packages, databases, and middleware systems in terms of functional coverage. This helps identify any integration problems or gaps in functional coverage.

[Application Architecture In Software Engineering](#)

The Definition of Software Architecture. In simple words, software architecture is the process of converting software characteristics such as flexibility, scalability, feasibility, reusability, and security into a structured solution that meets the technical and the business expectations. This definition leads us to ask about the characteristics of a software that can affect a software architecture design.
