In electrodynamics, this quantity is given by the cross product of a magnetic dipole with the external magnetic field. In classical mechanics, it can be expressed as the cross product of an object's angular velocity of precession and angular momentum but is more commonly given as the lever arm crossed with an applied force.

One thus deduces that the Schottky-Mott Rule describes the SBH of the metaphysical, non-interacting MS interfaces, put together without charge or atomic relaxation. Because of such, the Schottky-Mott Rule has very limited relevance for real MS interfaces and is not expected to be able to account for experimentally observed SBH.

Interestingly, we find that  $\sigma(\omega)$ , as a function of the frequency  $\omega$  of an applied ac electric field, is characterized by a small violation of the hyperscaling property in the clean limit, which is in marked contrast to the low-energy effective theories that possess Dirac quasiparticles in the excitation spectrum and obey ...
