Plugging in the given values of x , y and z gives $a + 2b - c = 3$, $a - 2 - c = 1$, $1 + 2b + c = 2$. Solving this system yields $a = 4$, $b = 0$, and $c = 1$. 1.1.3. (a) With Forward

Substitution, we just start with the top equation and work down. Thus $x = -6$ so $x = -3$.

Applications go hand-in-hand with theory, each reinforcing and explaining the other. This approach encourages students to develop not only the technical proficiency needed to go on to further study, but an appreciation for when, why, and how the tools of linear algebra can be used across modern applied mathematics.

However, Applied Linear Algebra by Olver and Shakiban completely reverses this procedure with a total integration of the application with the abstract theory. The effect on the reader is quite amazing. The reader slowly begins to realize two main points: (1) how applications generally drive the abstract theory, and (2) how the abstract theory ...
