"The capacitated transshipment
problem was originally developed
as an extension of the
transportation or distribution
problem. The transpor-tation
problem is a flow network model in
which every node is either an
origin or a destination.
Typically, the origins are
production plants and the
destinations are consumer markets
for some commodity, and a cost is
associated with shipping one unit
from a given plant to a given
market. If some intermediate nodes
are introduced, such as
warehouses, which are not origins
or destinations, the network

becomes a transshipment model. Finally, if some or all shipping routes, or arcs in the model, have limits in the amount of flow they may carry, the problem is termed "Capacitated." Any transshipment problem may be solved with a linear programming (LP) model, where each arc is a variable and each node is a constraint. The Simplex Method, commonly used in LP problems, may be specialized to solve these problems very efficiently by exploiting the inherent special network structure. The key property of networks, essential to the algorithm, is the spanning tree characterization of the basis. The Simplex Method pivots from one basic feasible solution, or spanning tree, to another until

optimality is reached. The basis tree provides a unique relationship between the basic variables and the constraints so that the reduced costs may be computed, the pivot procedure completed, and the basis priced out all by simple addition, rather than by matrix operations with the usual tableau. It also provides integer valued basic solutions when supplies, demands and arc bounds are integers"--Document.

The international refugee regime is
fundamentally broken. Designed in the wake
of World War II to provide protection and
assistance, the system is unable to address the
record numbers of persons displaced by
conflict and violence today. States have put
up fences and adopted policies to deny, deter,
and detain asylum seekers. People recognized

as refugees are routinely denied rights
guaranteed by international law. The results
are dismal for the millions of refugees around
the world who are left with slender prospects
to rebuild their lives or contribute to host
communities. T. Alexander Aleinikoff and
Leah Zamore lay bare the underlying global
crisis of responsibility. The Arc of Protection
adopts a revisionist and critical perspective
that examines the original premises of the
international refugee regime. Aleinikoff and
Zamore identify compromises at the founding
of the system that attempted to balance
humanitarian ideals and sovereign control of
their borders by states. This book offers a way
out of the current international morass
through refocusing on responsibility-sharing,
seeing the humanitarian-development divide

in a new light, and putting refugee rights front and center.

This book provides one of the first systematic in-depth studies on regional catastrophe risk pools. It explores the various goals of these new financial instruments, illustrating how they function on a conceptual, technical and practical level, and reconstructs their political genesis. With climate-related disasters increasing in frequency and severity, *Insuring Against Climate Change* explores how affected countries, especially those in the Global South, have increasingly turned to innovative index insurance instruments, as demonstrated by the creation of the Caribbean Catastrophic Risk Insurance Facility (CCRIF),

the African Risk Capacity (ARC) and the Pacific Catastrophe Risk Assessment and Financing Initiative Facility (PCRAFI Facility). Scherer scrutinizes the formation of this trend, exploring comparatively the goals, characteristics and histories of these tools, and argues that their attractiveness rests more on political than economic benefits and is, in fact, more supply than demand-driven. Making a significant contribution to current debates on the opportunities and limitations of what are sometimes described as indirect ‘climate risk insurance’, this book will be of great interest to political scientists with an interest in insurance instruments and climate-related disaster management politics as well as to practitioners working in the insurance, finance and the development sectors.

Through Waste-to-Energy (WtE) technology, plants use waste as a renewable fuel to co-produce electricity, heating, and cooling for urban utilization. This professional book presents the latest developments in WtE technologies and their global applications. The first part of the book covers thermal treatment technologies, including combustion, novel gasification, plasma gasification, and pyrolysis. It then examines 35 real-world WtE case studies from around the world, analyzing technical information behind planning, execution, goals, and national strategies. Results through the years show the benefits of the technology through the life cycle of the products. The book also examines financial and environmental aspects.

This splendid chapbook of thirteen poems by

Ralph Culver continues to add to his reputation as one of New England's most respected and authoritative voices. A true "poet's poet," Culver has collected in *So Be It* a cycle of poems, divided into three sections, that moves from "Boy at the Plate"--sharply pointed examinations of childhood memories--through compelling and at times disquieting poems on adulthood and family ("Last Call"), and concluding with the title section featuring a quartet of poems with a well-earned, meditative, spiritually generous worldview. As always, Culver's language is sensuous, evocative, almost cinematic in its descriptive prowess, encompassing a remarkable range of poetic styles from free to formal. From the cover: "In the title poem of this striking sheaf, Ralph Culver--one of New

England's truly distinguished voices--refers to '...this hunger. How it goes on, and tomorrow, and always, / blazing up in the body, torching the years to ash.' That seems to me an accurate precis of what goes on in *So Be It*. Though the perspective is generally retrospective (few if any have recalled the wonder and bafflement of childhood better than this poet), the 'blaze' of thought and emotion in his poetry carries vigorously forward into the present." --Sydney Lea

Arc-continent collision has been one of the important tectonic processes in the formation of mountain belts throughout geological time, and it continues to be so today along tectonically active plate boundaries such as those in the SW Pacific or the Caribbean. Arc-continent collision is thought to have been one of the most important processes involved in the growth of the continental crust over geological time, and may also play an important role in its recycling back into the mantle via subduction. Understanding the geological processes that take place during arc-continent collision is therefore of importance for our understanding of how collisional orogens evolve and how the continental crust grows or is destroyed. Furthermore, zones of arc-continent collision are producers of much of the world's primary economic wealth in the form of minerals, so understanding the processes that take place during these tectonic events is of importance in modeling how this mineral wealth is formed and preserved. This book brings together seventeen papers that are

dedicated to the investigation of the tectonic processes that take place during arc-continent collision. It is divided into four sections that deal firstly with the main players involved in any arc-continent collision; the continental margin, the subduction zone, and finally the volcanic arc and its mineral deposits. The second section presents eight examples of arc-continent collisions that range from being currently active through to Palaeoproterozoic in age. The third section contains two papers, one that deals with the obduction of large-slab ophiolites and a second that presents a wide range of physical models of arc-continent collision. The fourth section brings everything that comes before together into a discussion of the processes of arc-continent collision.

Authors of the book Arc Marine discuss results of a successful effort to create and define a data model for academic, government, military, and private oceanographers, resource managers, conservationists, geographers, nautical archaeologists, and analysts and managers of marine applications. Arc Marine is the perfect starting point for the intermediate marine student as well as a resource for the marine GIS expert. At a time when health of our oceans is seen as crucial to our existence, marine researchers have

developed a data model that supports sea floor mapping, fisheries management, marine mammal tracking, monitoring shoreline change, and water temperature analysis. This book enables marine professionals to do better work.

Bestselling author Michael Shermer's exploration of Where does he get the information to run a small science and morality that demonstrates how the ball mill or stamp mill? How does he set up and society as a whole, more moral From Galileo and dress a simple amalgam plate, retort some Newton to Thomas Hobbes and Martin Luther King, Jr., thinkers throughout history have consciously amalgam or make up a retort, and calculate the employed scientific techniques to better understand the percentage of gold in bullion? Where does a small operator find out how to set up a low-cost non-physical world. The Age of Reason and the cyanide plant and its running procedures? And Enlightenment led theorists to apply scientific

reasoning to the non-scientific disciplines of politics, economics, and moral philosophy. Instead of relying on the woodcuts of dissected bodies in old medical texts, physicians opened bodies themselves to see what was there; instead of divining truth through the authority of an ancient holy book or philosophical treatise, people began to explore the book of nature for themselves through travel and exploration; instead of the supernatural belief in the divine right of kings, people employed a natural belief in the right of democracy. In *The Moral Arc*, Shermer will explain how abstract reasoning, rationality, empiricism, skepticism--scientific ways of thinking--have profoundly changed the way we perceive morality and, indeed, move us ever closer to a more just world.
