Academic Press

A comprehensive book that

reviews advances in ocular motor research on topics of general interest, rare, specialized or unique conditions, and pertinent basic neuroscience. A rare collection with contributions from basic neuroscientists, neurologists, and ophthalmologists. Includes dedicated chapters on mathematical models, pharmacotherapy, neuromodulation, motion

perception, visual influence on eye movement, physiology of strabismus, and microsaccades. This book is dedicated to David Robinson - one of the pioneers of contemporary ocular motor and vestibular neuroscience.

Neuroscience Databases: A

Practical Guide is the first book providing a comprehensive overview of these increasingly important databases. This volume makes the results of the Human Genome Project and other recent large-scale initiatives in the neurosciences available to a wider community. It extends the scope of bioinformatics from the molecular to the cellular, microcircuitry and systems levels, dealing for the first time with complex neuroscientific issues and leading the way to a new culture of data sharing and data mining necessary to successfully tackle neuroscience questions. Aimed at the novice user who wants to access the data, it provides clear and concise instructions on how to download the available data sets and how to use the software with a minimum of technical detail with most chapters written by the database creators themselves.

Autism is no longer considered a rare disease, and the Center for Disease Control now estimates that upwards of 730,000 children

in the US struggle with this isolating brain disorder. New research is leading to greater understanding of and ability to treat the disorder at an earlier age. It is hoped that further genetic and imaging studies will lead to biologically based diagnostic techniques that could help speed detection and allow early, more effective intervention. Edited by two leaders in the field, this volume offers a current survey and synthesis of the most important findings of the neuroscience behind autism of the past 20 years. With chapters authored by experts in each topic, the volume explores etiology, neuropathology, imaging, and pathways/models. Offering a broad background of ASDs with a unique focus on neurobiology, the volume offers more than the others on the market with a strictly clinical focus or a single authored perspective that fails to offer expert, comprehensive coverage. Researchers and graduate students alike with an interest in developmental disorders and autism will benefit, as will autism specialists across

psychology and medicine looking to expand their expertise.

Uniquely explores ASDs from a neurobiological angle, looking to uncover the molecular/cellular basis rather than to merely catalog the commonly used behavioral interventions. Comprehensive coverage synthesizes widely dispersed research, serving as one-stop shopping for neurodevelopmental disorder researchers and autism specialists. Edited work with chapters authored by leaders in the field around the globe – the broadest, most expert coverage available.

The History of Neuroscience in Autobiography World Health Organization
The Avon Lady acquired iconic status in twentieth century American culture. This first history of Avon tells the story of a direct sales company that was both a giant in

its industry and a kitchen-table entrepreneurial venture. With their distinctive greeting at the homes across the country--Ding Dong! Avon Calling!--sales ladies brought door-to-door sales of makeup, perfume, and other products to American women beginning in 1886. Working for the company enabled women to earn money on the side and even become financially independent in a respectable profession while selling Avon's wares to friends, family, and neighborhood networks. Ding Dong! Avon Calling! is the story of women and entrepreneurship, and

of an innovative corporation largely managed by men that empowered women to exploit networks of other women and their community for profit. Founded in the late nineteenth century, Avon grew into a massive international direct sales company in which millions of "ambassadors of beauty" sat in their customers' living rooms with a sample case, catalogue, and a conversational sales pitch. Avon was unique in American business history for its reliance on women as representatives, promising them not just sales positions, but a chance to have a business of their own.

Being an Avon Lady avoided the stigma that was often attached to middle-class women's work outside the home and enabled women to maintain the delicate balance of work and family. Drawing for the first time on company records she helped acquire for archives, Katina Manko illuminates Avon's inner workings, uncovers the lives of its representatives, and shows how women slowly rose into the company's middle and upper management. Avon called itself "The Company for Women" and championed its high flyers, but its higher echelons remained dominated by men well into the 1990s. Avon is

more than perfumes and toiletries, but a brand built on women knocking on doors and chatting up neighbors. It thrived for more than a century through the deceptively simple technique of women directly selling beauty to women at home. A History of Explorations Into Brain Function Sinauer Associates, Incorporated Why psychology is in peril as a scientific discipline—and how to save it Psychological science has made extraordinary discoveries about the human mind, but can we trust everything its practitioners are telling us? In recent years, it has become

increasingly apparent that a lot of research in psychology is based on weak evidence, questionable practices, and sometimes even fraud. The Seven Deadly Sins of Psychology diagnoses the ills besetting the discipline today and proposes sensible, practical solutions to ensure that it remains a legitimate and reliable science in the years ahead. In this unflinchingly candid manifesto, Chris Chambers shows how practitioners are vulnerable to powerful biases that undercut the scientific method, how they routinely torture data until it produces outcomes that can be published in prestigious journals, and how studies are much less reliable than advertised. Left unchecked, these and other problems threaten the very future of psychology as a science—but help is here.

EBOOK: Public Mental Health: Global Perspectives Simon and Schuster

Although epilepsy is one of the nation's most common neurological disorders, public understanding of it is limited. Many people do not know the causes of epilepsy or what they should do if they see someone having a seizure. Epilepsy is a complex spectrum of disorders that affects an

estimated 2.2 million Americans in a variety of ways, and is characterized by unpredictable seizures that differ in type, cause, and severity. Yet living with epilepsy is about much more than just seizures; the disorder is often defined in practical terms, such as challenges in school, uncertainties about social situations and employment, limitations on driving, and questions about independent living. The Institute of Medicine was asked to examine the public health dimensions of the epilepsies, focusing on public health surveillance and data collection; population

and public health research; health policy, health care, and human services; and education for people with the disorder and their families, health care providers, and the public. In *Epilepsy Across the Spectrum*, the IOM makes recommendations ranging from the expansion of collaborative epilepsy surveillance efforts, to the coordination of public awareness efforts, to the engagement of people with epilepsy and their families in education, dissemination, and advocacy for improved care and services. Taking action across multiple dimensions will improve the lives of

people with epilepsy and their families. The realistic, feasible, and action-oriented recommendations in this report can help enable short- and long-term improvements for people with epilepsy. For all epilepsy organizations and advocates, local, state, and federal agencies, researchers, health care professionals, people with epilepsy, as well as the public, *Epilepsy Across the Spectrum* is an essential resource. *A Narrative History of Deaf America* Princeton University Press
As technology has made imaging of the brain noninvasive and inexpensive, nearly every psychologist in

every subfield is using pictures of the brain to show biological connections to feelings and behavior. *Handbook of Neuroscience for the Behavioral Sciences, Volume II* provides psychologists and other behavioral scientists with a solid foundation in the increasingly critical field of neuroscience. Current and accessible, this volume provides the information they need to understand the new biological bases, research tools, and implications of brain and gene research as it relates to psychology. Shedding new light on a controversial and intriguing issue, this book will reshape the debate on how the Judeo-Christian tradition views the morality of personal and

national self-defense. • Takes a multidisciplinary approach, directly engaging with leading writers on both sides of the issue • Examines Jewish and Christian sacred writings and commentary and explores how interpretations have changed over time • Offers careful analysis of topics such as the political systems of the ancient Hebrews, the Papacy's struggle for independence, the ways in which New England ministers incited the American Revolution, and the effects of the Vietnam War on the American Catholic church's views on national self-defense • Covers the many sects that have played crucial roles in the debate over the legitimacy of armed force, including Gnostics, Manicheans, Lutherans, Calvinists, and Quakers • Engages with the ideas of leading Jewish philosophers such as Rashi

and Maimonides; Christian philosophers such as Origen, Augustine, Aquinas, and Sidney; and the most influential modern exponents of pacifism, such as Dorothy Day, the Berrigan Brothers, and John Howard Yoder

Art Therapy and Clinical Neuroscience offers an authoritative introductory account of recent developments in clinical neuroscience and its impact on art therapy theory and practice. Contributors explore the complex relationship

between art and creativity and neurological functions such as those that occur during stress response, immune functioning, child developmental phases, gender difference, the processing of imagery, attachment, and trauma. It deciphers neuroscientific language and theory and contributes innovative concrete applications and interventions useful in art therapy. This book is essential reading for art therapists, expressive arts therapists, counselors, mental health practitioners, and students.

Joseph Babinski is best known for the 'Babinski Reflex' that all residents learn and nearly all neurologists, ER physicians and primary care physicians use at least once a day while seeing patients. The

Babinski reflex is ascertained when a blunt instrument is run along the underside of the foot from heel to toe. When the toe curls under or does nothing, this is a good sign. When the big toe flexes upward and the other toes spread, this is bad and may indicate upper motor neuron damage to the spinal cord or brain disease. But Babinski contributed more to neurology than just a 'simple reflex test' and this book Joseph Babinski: A Biography provides a new look at his work, avoiding the temptation to join the ranks of his unconditional admirers and detractors. The authors stick to the facts of Babinski's life, tracing the sources in forgotten archives and the extensive library

collections and, hopefully, exploring territory behind and beyond the traditional records. Above all nothing will be presented as true that cannot be proven with supporting documents. The Oxford Handbook of Cultural Neuroscience and Global Mental Health Oxford University Press Neuropathic pain involving the face can be very severe and disabling; often, it is hard to control with conventional means and requires use of unconventional interventions on various parts of the trigeminal nociceptive pathways. For the last 60 years, neuromodulation has been used specifically for the treatment of intractable pain in different parts of the human body, including the face and head region. Despite such a long history and existence of many neuromodulation targets,

there has not been a dedicated book that would summarize the entire spectrum of neuromodulation approaches that have been – and still are – used for treatment of facial pain. This book begins with dedicated chapters on classification of facial pain and anatomy of facial pain pathways and then dives into specific applications of neuromodulation starting from the periphery all the way to cerebral centers of pain processing, covering both invasive and non-invasive approaches. Written by experts from all over the world, the book offers an up-to-date comprehensive summary of neuromodulation techniques and modalities, providing the readers with a practical guide on clinical details of patient selection, modulation parameters, procedural details, and expected outcomes that may be used in daily

clinical practice dealing with most difficult facial pain conditions.

Neuroscience of Alcohol: Mechanisms and Treatment presents the fundamental information necessary for a thorough understanding of the neurobiological underpinnings of alcohol addiction and its effects on the brain. Offering thorough coverage of all aspects of alcohol research, treatment and prevention, and containing contributions from internationally recognized experts, the

book provides students, early-career researchers, and investigators at all levels with a fundamental introduction to all aspects of alcohol misuse. Alcohol is one of the world's most common addictive substances, with about two billion individuals worldwide consuming it in one form or another and three million annual deaths that are associated with alcohol misuse. Alcohol alters a variety of neurological processes, from molecular biology, to cognition. Moreover, addiction to alcohol can lead to numerous other health concerns and damage virtually every organ system in the

body, making diagnosis and treatment of individuals addicted to alcohol of critical importance. Integrates cutting-edge research on the pharmacological, cellular and molecular aspects of alcohol use, along with its effects on neurobiological function. Discusses alcohol use as a component of dual-use and poly addictions. Outlines numerous screening and treatment strategies for alcohol misuse. Covers both the physical and psychological effects of alcohol use and withdrawals to provide a fully-formed view of alcohol dependency and its effects.

This book is the second volume of autobiographical essays by distinguished senior neuroscientists; it is part of the first collection of neuroscience writing that is primarily autobiographical. As neuroscience is a young discipline, the contributors to this volume are truly pioneers of scientific research on the brain and spinal cord. This collection of fascinating essays should inform and inspire students and working scientists alike. The general reader interested in science may also find the essays absorbing, as they are essentially human stories about commitment and the pursuit of knowledge. The contributors

are: Lloyd M. Beidler, Arvid Carlsson, Donald R. Griffin, Roger Guillemin, Ray Guillery, Masao Ito. Martin G. Larrabee, Jerome Lettvin, Paul D. MacLean, Brenda Milner, Karl H. Pribram, Eugene Roberts and Gunther Stent. Key Features *

This volume encompasses all major methodologies to interrogate endocannabinoid systems (ECS) and endocannabinoids (eCBs) signaling. With increasing interest

towards the manifold activities of eCBs, this book discusses the chemical, biochemical, and molecular biological assays, and activity of distinct elements of the ECS. These include membrane, nuclear receptors, biosynthetic and hydrolytic enzymes, and membrane transporters and oxidative enzymes. Written in the highly successful *Methods in Molecular Biology* series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Timely and cutting edge, *Endocannabinoid Signaling: Methods and*

Protocols is a valuable resource and will help chemists, drug designers, biochemists, molecular biologists, cell biologists, pharmacologists, and (electro) physiologists navigate the mare magnum of endocannabinoid research. *A Monkey's Head, the Pope's Neuroscientist, and the Quest to Transplant the Soul* Academic Press Mental health is a fundamental public health priority, and this stimulating and comprehensive book brings together all of the key issues to offer an overview for students and practitioners alike. Written by a team of leading international experts, the book summarizes the evidence base and asks the key

questions at the heart of a range of topics from community development to public mental health in schools and recovery and well-being. The book includes: Mini toolkits at the end of each chapter that include tips for effective practice, reflection points and questions to consider Case studies exploring real world examples of public mental health in action Discussion and opinion encouraging readers to question and debate the issues at the core of public mental health policy The book also includes a chapter written by Kate E. neuroscience and global mental health. Theory, methods and evidence-based practices are reviewed and integrated across themes that identify ethical, scientific, and health care issues for distinct populations across nations. The international research collaboration in the field of cultural neuroscience and global mental health provides research and training opportunities for global mental health researchers. Future research and training in the field seeks the achievement of the amelioration of disease and fulfillment of the goal to alleviate the unmet societal needs due to the global burden of disease"--
