The Secret Teachings of All Ages GENERAL PRESS

Interactions between the fields of physics and biology reach back over a century, and some of the most significant developments in biology—from the discovery of DNA's structure to imaging of the human brain—have involved collaboration across this disciplinary boundary. For a new generation of physicists, the phenomena of life pose exciting challenges to physics itself, and biophysics has emerged as an important subfield of this discipline. Here, William Bialek provides the first graduate-level introduction to biophysics aimed at physics students. Bialek begins by exploring how photon counting in vision offers important lessons about the opportunities for quantitative, physics-style experiments on diverse biological phenomena. He

draws from these lessons three general physical principles—the importance of noise, the need to understand the extraordinary performance of living systems without appealing to finely tuned parameters, and the critical role of the representation and flow of information in the business of life. Bialek then applies these principles to a broad range of phenomena, including the control of gene expression, perception and memory, protein folding, the mechanics of the inner ear, the dynamics of biochemical reactions, and pattern formation in developing embryos. Featuring numerous problems and exercises throughout, Biophysics emphasizes the unifying power of abstract physical principles to motivate new and novel experiments on biological systems. Covers a range of biological phenomena from the physicist's perspective Features 200 problems Draws on statistical mechanics, quantum mechanics, and related mathematical concepts Includes an annotated bibliography and detailed appendixes Instructor's manual (available only to teachers) Expert First Student's Resource Book with Key Simon and Schuster

The brilliant, controversial, bestselling critique of American culture that “ hits with the approximate force and effect of electroshock therapy ” (The New York Times)—now featuring a new afterword by Andrew Ferguson in a twenty-fifth anniversary edition. In 1987, eminent political philosopher Allan Bloom published *The Closing of the American Mind*, an appraisal of contemporary America that “ hits with the approximate force and effect of electroshock therapy ” (The New York Times) and has not only been vindicated, but has also become more urgent today. In clear, spirited prose, Bloom argues that the social and political crises of contemporary America are part of a larger intellectual crisis: the result of a dangerous narrowing of curiosity and exploration by the university elites. Now, in this twenty-fifth anniversary edition, acclaimed author and journalist Andrew Ferguson contributes a new essay that describes why Bloom 's argument caused such a furor at publication and why our culture so deeply resists its truths today.

Modern Political Economics Macmillan Higher Education Researchers from a variety of disciplines have collected verbal protocols of reading as a window on conscious reading processes. Because such work has occurred in different disciplines, many who have conducted verbal protocol analyses have been unaware of the research of others. This volume brings together the existing literature from the various fields in which verbal protocols of reading have been generated. In so doing, the authors provide an organized catalog of all conscious verbal processes reported in studies to date -- the most complete analysis of conscious reading now available in the literature. When the results of all of the studies are considered, there is clear support for a number of models of reading comprehension including reader response theories, schema perspectives, executive processing models, and bottom-up approaches such as the one proposed by van Dijk and Kintsch. The summary of results also demonstrates that none of the existing models goes far enough. Thus, a new framework -- constructively responsive reading -- is described. This new model encompasses reader response, schematic and executive processing, and induction from word- and phrase-level comprehension to higher-order meaning. The important concept in this new model is that readers respond to bits and pieces of text as they are encountered, all as part of the overarching goal of constructing meaning from text. This volume also includes a critical review of the thinking aloud methodology as it has been used thus far. This examination suggests that it continues to be an immature methodology, and that much work is needed if a complete theory of conscious processing during reading is to be developed via verbal protocol analysis. Finally, after reviewing what has been accomplished to date, the authors provide extensive discussion of the work that remains to be done and the adequacy of the verbal protocol methodology for permitting telling conclusions about text processing.
