?Ask one intriguing question, then answer
it.? This was the assignment given to four
classes of Biology Honors students. Each
student generated and refined one
question. Each then sought the answer.
This book is a collection of those
questions and answers.

This book examines information
processing performed by bio-
systems at all scales: from
genomes, cells and proteins to
cognitive and even social systems.
It introduces a
theoretical/conceptual principle
based on quantum information and
non-Kolmogorov probability theory
to explain information processing
phenomena in biology as a whole.
The book begins with an
introduction followed by two

chapters devoted to fundamentals,
one covering classical and quantum
probability, which also contains a
brief introduction to quantum
formalism, and another on an
information approach to molecular
biology, genetics and epigenetics. It
then goes on to examine adaptive
dynamics, including applications to
biology, and non-Kolmogorov
probability theory. Next, the book
discusses the possibility to apply
the quantum formalism to model
biological evolution, especially at
the cellular level: genetic and
epigenetic evolutions. It also
presents a model of the epigenetic
cellular evolution based on the
mathematical formalism of open
quantum systems. The last two
chapters of the book explore
foundational problems of quantum
mechanics and demonstrate the
power of usage of positive operator
valued measures (POVMs) in
biological science. This book will
appeal to a diverse group of readers
including experts in biology,

cognitive science, decision making,
sociology, psychology, and physics;
mathematicians working on
problems of quantum probability
and information and researchers in
quantum foundations.

Asking Questions in Biology
McGraw Hill

Annotation. "What is life? What does it mean to be alive? Is the Earth a super-organism? Is God necessary? In *Biology and the Riddle of Life* Charles Birch confronts these fundamental questions at a time when such topics as genetic engineering, cloning and ecology have been prominent in the news. Birch confronts the impression that modern biology has answers to all that there is to be known about life. We need to move towards an understanding of living creatures as subjects, and not only as objects, in order to probe life's hidden secrets - what it is to be alive, what it is to experience pain, and what it is to be in love. The answer must include the meaning of life for us as individuals. Birch proposes a new perspective to bring subject and object together. This is the black box he has opened."--BOOK JACKET. Biology is where many of science's

most exciting and relevant advances are taking place. Yet, many students leave school without having learned basic biology principles, and few are excited enough to continue in the sciences. Why is biology education failing? How can reform be accomplished? This book presents information and expert views from curriculum developers, teachers, and others, offering suggestions about major issues in biology education: what should we teach in biology and how should it be taught? How can we measure results? How should teachers be educated and certified? What obstacles are blocking reform?

For decades, we have been told we live in the “information age” —a time when disruptive technological advancement has reshaped the categories and social uses of knowledge and when quantitative assessment is increasingly privileged. Such methodologies and concepts of information are usually considered the provenance of the natural and social sciences, which present them as politically and philosophically neutral. Yet the humanities should and do play an important role in interpreting and critiquing the historical, cultural, and conceptual nature of information. This book is one of two companion volumes that explore theories and histories of information from a humanistic perspective. They consider information as a long-standing feature of social, cultural, and conceptual management, a matter of social practice, and a

fundamental challenge for the humanities today. Bringing together essays by prominent critics, *Information: Keywords* highlights the humanistic nature of information practices and concepts by thinking through key terms. It describes and anticipates directions for how the humanities can contribute to our understanding of information from a range of theoretical, historical, and global perspectives. Together with *Information: A Reader*, it sets forth a major humanistic vision of the concept of information. *Artificial Intelligence in Education* Maple Tree Press
