What would happen if someone invented a machine that could create an exact duplicate of anything? That is the simple but remarkable premise of Damon Knight's classic 1959 novel, A for Anything. "The Gismo," as the machine is known, seems like it will end poverty and need forever. But of course, things are not that simple. Like any truly great work of science fiction, Knight's novel boldly pursues the ramifications of his premise. What will people do if there is no longer any need to work for anything? What happens if this device is spread carelessly throughout the world (it can even duplicate itself!). Finally, there is the supreme and most chilling of questions: what happens if you try to duplicate a human being? A for Anything is a classic work of science fiction, but it considers questions that are as relevant and compelling today as they were fifty years ago, perhaps more so. Like most of us, Knight watches the mind-boggling technological advancements of our time with a mixture of awe and alarm, and wonders whether we are really in control of the things we are creating. Knight has put his finger on the pulse of our modern sensibility and, mixed with his truly remarkable imagination, created a novel that is gripping, thought-provoking and impossible to put down.

Praise for the first edition: "The well-written, comprehensive book...[is] aiming to become a de facto reference for the language and its features and capabilities. The pace is appropriate for beginners; programming concepts are introduced progressively through a range of examples and then used as tools for building applications in various domains, including sophisticated data structures and algorithms...Highly recommended. Students of all levels, faculty, and professionals/practitioners. —D. Papamichail, University of Miami in CHOICE Magazine Mark Lewis ' Introduction to the Art of Programming Using Scala was the first textbook to use Scala for introductory CS courses. Fully revised and expanded, the new edition of this popular text has been divided into two books. Object-Orientation, Abstraction, and Data Structures Using Scala, Second Edition is intended to be used as a textbook for a second or third semester course in Computer Science. The Scala programming language provides powerful constructs for expressing both object orientation and abstraction. This book provides students with these tools of object orientation to help them structure solutions to larger, more complex problems, and to expand on their knowledge of abstraction so that they can make their code more powerful and flexible. The book also illustrates key concepts through the creation of data structures, showing how data structures can be written, and the strengths and weaknesses of each one. Libraries that provide the functionality needed to do real programming are also explored in the text, including GUIs, multithreading, and networking. The book is filled with end-of-chapter projects and exercises, and the authors have also posted a number of different supplements on the book website. Video lectures for each chapter in the book are also available on YouTube. The videos show construction of code from the ground up and this type of "live coding" is invaluable for learning to program, as it allows students into the mind of a more experienced programmer, where they can see the thought processes associated with the development of the code. About the Authors Mark Lewis is an Associate Professor at Trinity University. He teaches a number of different courses, spanning from first semester introductory courses to advanced seminars. His research interests included simulations and modeling, programming languages, and numerical modeling of rings around planets with nearby moons. Lisa Lacher is an Assistant Professor at the University of Houston, Clear Lake with over 25 years of professional software development experience. She teaches a number of different courses spanning from first semester introductory courses to graduate level courses. Her research interests include Computer Science Education, Agile Software Development, Human Computer Interaction and Usability Engineering, as well as Measurement and Empirical Software Engineering.

Recent scholarship points to a "new institutionalism" just as recent political developments point to a trend toward democratization. If institutions matter, and if legislatures are the democratic institutions in which the voice of the people speaks, then the organization of legislatures—bi- or unicameral—has important consequences for democracy.
