In addition to the famous work of Dr. Frank Netter, you'll also find nearly 100 paintings by Dr. Carlos A. G. Machado, one of today's foremost medical illustrators. Region-by-region coverage, including Muscle Table appendices at the end of each section. Large, clear illustrations with comprehensive labels not only of major structures, but also of those with important

relationships. Updates to the 7th Edition - based on requests from students and practitioners alike: New Systems Overview section featuring brand-new, full-body views of surface anatomy, vessels, nerves, and lymphatics. More than 25 new illustrations by Dr. Machado, including the clinically important fascial columns of the neck, deep veins of the leg, hip bursae, and vasculature of the prostate; and difficult-to-visualize areas like the infratemporal fossa. New Clinical Tables at the end of each regional section that focus on structures with high clinical significance. These tables provide quick summaries, organized by body system, and indicate where to best view key structures in the illustrated plates. More than 50 new radiologic images - some completely new views and others using newer imaging tools - have been included based on their ability to assist readers in grasping key elements of gross anatomy. Updated terminology based on the international anatomic standard, Terminologia Anatomica, with common clinical eponyms included.

The Pocket Atlas of Human Anatomy Saunders

AFTER ten years' preparation the first edition of our Atlas of Human Anatomy was published between 1946 and 1951. Our experience enabled us to improve each of the subsequent editions and the present one has also been thoroughly revised and enlarged to allow the inclusion of more instructive illustrations. Throughout we have adhered to our original intention that this work should be a well proportioned Atlas of life-like illustrations primarily for medical students but also useful to the practising physician and surgeon. The introduction of topographical illustrations in the third volume has been welcomed by readers and, while not embarking on histology, semi-microscopic figures have been introduced into some chapters for a better understanding of function. We did not deviate without reason from the currently accepted methods of illustrating the elements of the different systems such as bones, joints, muscles, vessels and nerves and we were at pains to base our illustrations on original dissections and to include in them

only essential details. The use of colour in the illustrations, introduced by the Italian anatomist Aselli (1627), was with didactic intent. The legends to the illustrations of this edition use the nomenclature of the "Nomina Anatomica", Paris 1955 (PNA) , as revised in New York in 1960.

There's never been anything like this before: the very first anatomically exact, and complete, three-dimensional, computer-generated reconstruction of actual human anatomy. These amazing color images come to life thanks to the National Library of Medicine's Visible Human Project(TM). For every structure, the database generates a incredibly detailed "wire frame" image, which then underwent contour mapping for a more realistic picture. First, the systemic anatomy appears: the skeletal, muscular, nervous, endocrine, circulatory, respiratory, digestive, urinary, and reproductive systems. Then, the focus is on the regional anatomy, including the head and neck (with brain, eye, and ear); thorax (with lungs and heart); abdomen (stomach, liver, gallbladder, spleen, intestines, kidney); pelvis; upper limb (arm, elbow, forearm, hand); and lower limb (thigh, knee, legs, and foot). It's the most fascinating mirror on our own construction ever produced, and will enthrall students, doctors, scientists, and anyone interested in the miracle that is the human body.

The short notes that accompany many of the keys either make a comment on the particular items in the specimens for draw attention to general points in the region concerned. They are not intended in any way to provide a comprehensive description of everything seen; our aim is to supplement existing texts, not to substitute for them. In order to produce a volume of reasonable proportions both in size and in price we have had to be selective in choosing the illustrations from the material available to us. We have deliberately chosen a variety of cadaveric and museum specimens, since different methods of preparation and preservation give a range of appearances as far as colour is concerned, and the student must not imagine that all specimens will look the same no matter how they have been treated.
