Each year more than 4 million children are born with birth defects. This book highlights the unprecedented opportunity to improve the lives of children and families in developing countries by preventing some birth defects and reducing the consequences of others. A number of developing countries with more comprehensive health care systems are making significant progress in the prevention and care of birth defects. In many other developing countries, however, policymakers have limited knowledge of the negative impact of birth defects and are largely unaware of the affordable and effective interventions available to reduce the impact of certain conditions. Reducing Birth Defects: Meeting the Challenge in the Developing World includes descriptions of successful programs and presents a plan of action to address critical gaps in the understanding, prevention, and treatment of birth defects in developing countries. This study also recommends capacity building, priority research, and institutional and global efforts to reduce the incidence and impact of birth defects in developing countries.

This forms part of WHO's efforts towards improving the quality of care for leading causes of maternal death especially those clustered around the time of childbirth in the post-MDG era. Specifically it presents evidence-based recommendations on interventions for preventing and treating genital tract infections during labour childbirth or puerperium with the aim of improving outcomes for both mothers and newborns. The primary audience for this guideline is health professionals who are responsible for developing national and local health protocols and policies as well as managers of maternal and child health programmes and policy-makers in all settings. The guideline will also be useful to those directly providing care to pregnant women including obstetricians midwives nurses and general practitioners. It has been established that, by implementing timely and appropriate evidence-based practices, antenatal care can save lives. Endorsed by the United Nations Secretary-General, this is a comprehensive WHO guideline on routine antenatal care for pregnant women and adolescent girls. It aims to complement existing WHO guidelines on the management of specific pregnancy-related complications. Birth Defects Surveillance: A Manual for Programme Managers was highly commended in the Public Health category of the British Medical Association 2015 Medical Book Competition. Congenital anomalies, also known as birth defects, are structural or functional abnormalities, including metabolic disorders, which are present from birth. Congenital anomalies are a diverse group of disorders of prenatal origin, which can be caused by single gene defects, chromosomal disorders, multifactorial inheritance, environmental teratogens or micronutrient deficiencies. This manual is intended to serve as a tool for the development, implementation and ongoing improvement of a congenital anomalies surveillance program, particularly for countries with limited resources. The focus of the manual is on population-based and hospital-based surveillance programs. Some countries may not find it feasible to begin with the development of a population-based program. Therefore, the manual focuses on the methodology needed for the development of both population-based and hospital-based surveillance program. Further, although many births in predominantly low- and middle-income countries occur outside of hospitals, some countries with limited resources may choose to start with a hospital-based surveillance program and expand it later into one that is population based. Any country wishing to expand its current hospital-based program into a population-based program, or to begin the initial development of a population-based registry, should find this manual helpful in reaching its goal. This manual provides selected examples of congenital anomalies. Typically, these anomalies are severe enough that they would probably be captured during the first few days following birth. Also, because of their severity and frequency, these selected conditions have significant public health impact, and for some there is a potential for primary prevention. Nevertheless, these are just suggestions, and countries can choose to monitor a subset of these conditions or add other congenital anomalies to meet their needs. This manual is a collaborative effort between the World Health Organization (WHO), the National Center on Birth Defects and Developmental Disabilities from the US Centers for Disease Control and Prevention (CDC) and the International Clearinghouse for Birth Defects Surveillance and Research (ICBDSR).

We at 4th Watch Publishing are former government employees, so we know how government employees actually use the handbooks. When a new handbook is released, a personnel specialist prints it out, punches holes and puts it in a 3-ring binder. While this is not a big deal for a 5 or 10-page document, many OPM documents are over 100 pages and printing a large document is a time-consuming effort. So, a personnel specialist that's paid \$25 an hour is spending hours simply printing out the tools needed to do the job. That's time that could be better spent.
