collisions occupy a  
strategic position  
at the intersection

of several powerful  
themes of current  
research in  
chemical physics,  
in atomic,  
molecular and  
optical physics,  
and even in  
condensed matter.  
The nature of these

important  
consequences for

manipulation of

inelastic and reactive processes, precision measurement of molecular and atomic properties, matter-wave coherences and quantum-statistical condensates of dilute, weakly interacting atoms. This crucial position explains the wide interest and explosive growth of the field since its inception in 1987. The author reviews elements of the quantum theory of scattering theory, collisions taking place in the presence of one or more light fields, and collisions in the dark, below the

photon recoil limit imposed by the presence of any light field. Finally, it reviews the essential properties of these mesoscopic quantum systems and describes the key importance of the scattering length to condensate stability.
