This research study used a mixed methods approach to determine whether students in the Electrical Engineering Technology (EET) Bachelor's

Program were being exposed to critical thinking and if their critical thinking skills were increasing. For the quantitative portion, students were given a pre and post-test using the Watson Glaser Critical Thinking Assessment. The qualitative portion of this study involved classroom observations and interviews. The study consisted of nine students in their senior year while attending three classes. Each of the classes was observed to help understand how three separate instructors were

---

incorporating critical thinking into the classrooms. The quantitative findings did not show significant gains in critical thinking as a whole. The small sample group could be a factor for not finding significant gains. Observations of the classes showed that two of the three classes were being taught with rote memorization. The third class attempted to incorporate Problem Based Learning (PBL) techniques. Through student interviews I noticed that the students

seemed to prefer the rote memorization classes. This could stem from their lack of PBL learning in the past. The findings of this study show that current EET students are not being given the chance to increase their critical thinking skills.

 This book will explain how to

verify SoC (Systems on Chip) logic designs using "formal and semiformal verification techniques. The critical issue to be addressed is whether the functionality of the design is the one that the designers intended. Simulation has been used for checking the correctness of SoC designs (as in "functional verification), but many subtle design errors cannot be caught by simulation. Recently, formal verification, giving mathematical

proof of the correctness of designs, has been gaining popularity. For higher design productivity, it is essential to debug designs as early as possible, which this book facilitates. This book covers all aspects of high-level formal and semiformal verification techniques for system level designs. • First book that covers all formal and semiformal, high-level (higher than RTL) design verification targeting SoC

This is the first study to comprehensively investigate economic revitalization strategies in a state economy that, until recently, had been the most powerful in the United States. In sixteen original essays, Reindustrializing New York State documents the state's long-term deindustrialization and examines and evaluates the policies initiated to

---

reverse its decline. Pursuing an analysis of each of the strategies crucial to New York's economic redevelopment, the authors assess the significance of the state's policy actions and inactions, while focusing attention on problems and trends likely to pose formidable barriers to future growth. What crystallizes is the image

of a state in passage to a radically different stage of political, social, and economic organization with new possibilities as well as new hazards. *Careers Forgotten Books Field-Programmable Custom Computing Technology: Architecture s, Tools, and Applications* brings together in one place important co
