This book answers the question “ What is it that viruses do? ” by presenting three aspects of viral ecology. The first aspect explains how viruses affect the population diversity and energetics of their host communities. Perhaps the most notable example of this concept is our understanding that primary production within ecosystems often depends upon those viruses which serve as controllers of nutrient recycling, connecting the aquatic and terrestrial realms in ways that can be assessed locally and globally. The second aspect describes genetic partnerships which exist between hosts and their viruses. These include processes termed endogeny and lysogeny by which the host carries at least a partial genomic copy of the virus. Fluidity of these collective genomes is expressed on an evolutionary time scale and the mutual life cycles which they produce represent a forging of shared genomic fate that obligates partnership of the virus and its host. The viral sequences represent a source of potential benefit as well as potential peril for the host and can implement phenotypic changes in the host. Hosts often use those changes as tools. As humans, the most notable example would be that mammals rely upon temporary activation of their endogenous viral genes in order to successfully develop a placenta. The third aspect is defending the health of a host, which relies upon activity in two directions. Hosts often use their captured viral genes to identify and subsequently direct battle against invading viruses. This natural concept has been engineered for combating cancer, is useful for suppressing the detrimental consequences of genetic diseases, and has been developed to create targeted antiviral vaccines. But, the defense has to work in two directions and the host can use other symbiotic microorganisms as protection against its viruses. This book will appeal to a wide readership by providing a broad perspective of viral ecology, and all scientists will find it helpful for gaining a view of fields beyond their specialization.

Viruses are big news. From pandemics such as HIV, swine flu, and SARS, we are constantly being bombarded with information about new lethal infections. In this Very Short Introduction Dorothy Crawford demonstrates how clever these entities really are. From their discovery and the unravelling of their intricate structures, Crawford demonstrates how these tiny parasites are by far the most abundant life forms on the planet. With up to two billion of them in each litre of sea water, viruses play a vital role in controlling the marine environment and are essential to the ocean's delicate ecosystem. Analyzing the threat of emerging virus infections, Crawford recounts stories of renowned killer viruses such as Ebola and rabies as well as the less known bat-borne Nipah and Hendra viruses. Pinpointing wild animals as the source of the most recent pandemics, she discusses the reasons behind the present increase in potentially fatal infections, as well as evidence suggesting that long term viruses can eventually lead to cancer. By examining our lifestyle in the 21st century, Crawford looks

to the future to ask whether we can ever live in harmony with viruses, and considers the ways in which we may need to adapt to prevent emerging viruses with devastating consequences. ABOUT THE SERIES: The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area. These pocket-sized books are the perfect way to get ahead in a new subject quickly. Our expert authors combine facts, analysis, perspective, new ideas, and enthusiasm to make interesting and challenging topics highly readable.

course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand. We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book,

adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand--and apply--key concepts.

This is a modern story about a boy and his school friends, who all wonder about the coronavirus. Trying to find out the best way to keep it away from their beloved grandparents, they are going on a school trip, a rather exciting adventure. While the trip itself provides lots of information that will lead to the very happy (and giggly) ending of this story, the story unfolds with the help of their teacher, Miss Hope. Is Miss Hope going to help them find the answer? Will knowing karate, or swimming help to fight the virus? And what are apples got to do with this? Expect lots of laughter, a school trip and...the appearance of Corona itself, as well as a few of her nasty friends. "The rainbow" will also make a special appearance. A tribute to all children and their

grandparents who could not see each other during the 2020 lockdown.

Microbiology and virology laboratories provide a diagnostic service that supports the management of patients under the care of front-line clinicians. Despite the significant overlap, laboratory expertise and clinical patient management are traditionally viewed as independent entities. Trainees in the infection disciplines of microbiology, virology, infectious diseases, and tropical medicine have until recently received separate, and as a result, limited training. To address this problem, the UK replaced the FRCPath Part 1 examination for infectious disease trainees with a combined infection training (CIT) curriculum in 2015. Based on the idea of integration and collaboration within the field, CIT links laboratory expertise to clinical patient management. Tutorial Topics in Infection for the Combined Infection Training Programme is the first book covering the complete CIT curriculum. Following the format of the CIT certificate examination, each chapter ends with three single

best answer multiple choice questions accompanied by in-depth discussions. This extensive content helps students appreciate the breadth of knowledge required, emphasises how the different aspects of the field are related, and is an essential tool for those preparing for the CIT certificate examination. Written by a multi-disciplinary team of medical microbiologists, virologists, infectious disease physicians, clinical scientists, biomedical scientists, public health specialists, HIV clinicians, and infection control nurses, this well-illustrated and easy to use book offers a unique insight into infectious diseases. It is the perfect primer for further study, a starting point for medical students and professionals wishing to learn more about the different topics within the infection specialty, and ideal for biomedical scientists looking to broaden their clinical understanding of the field beyond the diagnostic test.
