BACTERIA AND VIRUSES • A\* Biology

Bacteria and viruses provide medical significance to all life forms especially in humans. Bacteria present what other animals possessed, and that is the "cellular" characteristic. Most of the scientist won't consider viruses as "microorganisms" for a very simple reason that they are acellular or therefore nonliving in nature just like the viroids and prions.

Introduction To Bacteria And

Viruses Answer Key

Viruses are much smaller than bacteria and are not considered living organisms. They are infectious agents with only a protein shell and a strand of RNA or DNA, depending on the type of virus. They do not reproduce on their own—like bacteria do. Instead, viruses need a host cell to do the reproducing for them (you'll learn more about that below.)

Answers to Common Questions About How Viruses Work - Ask ...

Answer From Pritish K. Tosh, M.D. As you might think, bacterial infections are caused by bacteria, and viral infections are caused by viruses. Perhaps the most important distinction between bacteria and viruses is that antibiotic drugs usually kill bacteria, but they aren't effective against viruses. *Virus And Bacteria With Answer Sheets Worksheets - Kiddy Math*

Viruses are not living organisms, bacteria are. Viruses only grow and reproduce inside of the host cells they infect. When found outside of these living cells, viruses are dormant. Their "life" therefore requires the hijacking of the biochemical activities of a living cell.

*Differences Between Bacteria and Viruses*

Official Answer Bacteria and viruses differ in their structure and their response to medications. Bacteria are single-celled, living organisms. They have a cell wall and all the components necessary to survive and... Viruses are not considered to be "living" because they require a host cell to ...
