This volume covers the main sectors of dairy technology, their basic science and manufacture, their mechanisation and automation, and their quality control. Like any major and highly developed sector of food manufacturing, the dairy foods industry is now highly mechanised, from raw material production through to processing and product manufacture. This book has been written to show the extent and advantages of mechanisation across the range of dairy technology, and to explain the principles and rationale of introducing automated systems. In this way, authors demonstrate how combinations of state-of-the-art machinery and dedicated control systems bring to the dairy industry increased efficiency, higher quality and consistency, and opportunities for product innovation through its technological base. The volume is directed at food scientists and technologists, quality assurance personnel, analytical chemists, microbiologists, and consultants in automation and expert systems. The mathematical theory of contact mechanics is a growing field in engineering and scientific computing. This book is intended as a unified and readily accessible source for mathematicians, applied mathematicians, mechanicians, engineers and scientists, as well as advanced students. The first part describes models of the processes involved like friction, heat generation and thermal effects, wear, adhesion and damage. The second part presents many mathematical models of practical interest and demonstrates the close interaction and cross-fertilization between contact mechanics and the theory of variational inequalities. The last part reviews further results, gives many references to current research and discusses open problems and future developments. The book can be read by mechanical engineers interested in applications. In addition, some theorems and their proofs are given as examples for the mathematical tools used in the models.
