Thevenin ' s theorem states that any two terminal linear network or circuit can be represented with an equivalent network or circuit, which consists of a voltage source in series with a resistor. It is known as Thevenin ' s equivalent circuit. A linear circuit may contain independent sources,

dependent sources, and resistors.

All these different laws and theorems belong to electrical, electronic and mechanical studies. Before this article, I have explained the Basic Concept Electrical Circuit. They are used to solve the electrical network. To solve these electrical circuits, you also need to apply multiple Electrical Laws and Theorems so that you can calculate the required values for various parameters.

The basic procedure for solving a circuit using Thevenin's Theorem is as follows: 1. Remove the load resistor R_L or component concerned. 2. Find R_S by shorting all voltage sources or by open circuiting all the current sources. 3. Find V_S by the usual circuit analysis methods. 4. Find the current flowing through the load resistor R_L .
