"The book may be visualized as having three major sections. The first, encompassing the first three chapters, is an introduction to the engineering profession. Chapter 1 provides information on engineering disciplines and functions. If a formal orientation course is given separately, Chapter 1 can be simply a reading assignment and the basis for students to investigate disciplines of interest. Chapter 2 outlines the course of study and

preparation for an engineering work environment. Interdisciplinary projects, teaming, and ethics are discussed. Chapter 3 is an introduction to the design process. If time permits, this material can be supplemented with case studies and your personal experiences to provide an interesting and motivating look at engineering"--

For decades the Northern Territory's criminal law has stood at the jurisprudential frontier of Australia: grappling with a unique set of circumstances, almost entirely dominated by the situation of its Aboriginal people. This 2nd edition deals in detail with the sweeping changes introduced in 2005 by Part IIAA of the NT Criminal

Code. These changes often mirror the Criminal Code (Cth), and have completely rewritten many of the NT Code's most significant provisions, including the law of murder, rape, and many serious offences against the person. The book covers procedure and all the major offences, together with public order offences and sentencing. It contains a separate chapter on Aboriginal people that deals with all the recent developments, including the Intervention, and a detailed chapter on the unique history of the Territory's criminal law.

Proteins are the servants  
of life. They occur in all  
component parts of living

staggering in their functional variety, despite their chemical similarity. Even the simplest single-cell organism contains a thousand different proteins, fulfilling a wide range of life-supporting roles. Their production is controlled by the cell's genetic machinery, and a malfunction of even one protein in the cell will give rise to pathological symptoms. Additions to the total number of known proteins are constantly being made on an increasing scale through the discovery of mutant strains or their production by genetic manipulation; this latter technology has become known as protein engineering. The in vivo functioning of proteins depends critically on the chemical structure of individual peptide chains, but also on the detailed folding of the chains themselves and on their assembly into larger supramolecular structures. The molecules and their functional assemblies possess a limited in vitro stability. Special methods are required for their intact isolation from the source material and for their analysis, both qualitatively and quantitatively. Proteins are also increasingly used as "industrial components," e.g., in biosensors and immobilized enzymes, because of their specificity, selectivity, and sensitivity. This requires novel and refined processing methods by which the protein isolate can be
