This second edition of *Uniform Evidence Law: Principles and Practice* is an invaluable reference for students of evidence law and litigation practitioners. It provides a succinct, clear and comprehensive statement and analysis of the Uniform Evidence Law as at November 2014. The book provides an overarching and detailed analysis of the law of evidence applicable in those jurisdictions that have adopted the model Uniform Evidence Law: the Commonwealth, New South Wales, Tasmania, Victoria, Australian Capital Territory and now, since 2012, the Northern Territory. Students will gain invaluable insight from the authors who analyse the Uniform Evidence Law by reference to its history, its underlying policy and its operation in practice. Explanations and evaluations of the principles on which the law is based, identification of its often-conflicting rationales, and suggestions for how it might be made more principled and coherent will prove extremely helpful for students. Reinforced Concrete Basics has been written for students and practising structural engineers. It provides an up-to-date, practical treatment of reinforced concrete design in accordance with the current, amended edition of the Australian Concrete Structures Standard AS 3600, and takes account of latest industry developments, including the use of high-strength concrete and higher-strength reinforcing steel. The concepts of analysis and design are presented from a fundamental viewpoint so that the text will be of value to readers using other codes and standards. The text takes readers to the stage where they can undertake, with confidence, the design of structural elements such as beams, slabs, columns and walls and simple concrete structures such as building frames and continuous girders. This third edition became necessary because of important changes recently made to AS 3600. These include new approaches to calculating crack widths and to design for shear and torsion, as well as changes in the capacity reduction factors (ϕ), and hence the implied safety levels in the AS 3600 design procedures.

Proteins are the servants of life. They occur in all component parts of living organisms and are staggering in their functional variety, despite their chemical similarity. Even the simplest single-cell organism contains a thousand different proteins, fulfilling a wide range of life-supporting roles. Their production is controlled by the cell's genetic machinery, and a malfunction of even one protein in the cell will give rise to pathological symptoms. Additions to the total number of known proteins are constantly being made on an increasing scale through the discovery of mutant strains or their production by genetic manipulation; this latter technology has become known as protein engineering. The in vivo functioning of proteins depends critically on the chemical structure of individual peptide chains, but also on the detailed folding of the chains themselves and on their assembly into larger supramolecular structures. The molecules and their functional assemblies possess a limited in vitro stability. Special methods are required for their intact isolation from the source material and for their analysis, both qualitatively and quantitatively. Proteins are also increasingly used as "industrial components," e.g., in biosensors and immobilized enzymes, because of their specificity, selectivity, and sensitivity. This requires novel and refined processing methods by which the protein isolate can be converted into a form in which it can be utilized.
