Because of the recent revival of interest in superconductivity, we have felt that a pedagogical, yet concise review of the fundamental ideas of the Bardeen-Cooper-Schrieffer (BCS) theory of superconductivity is timely. We discuss the basic ideas of the BCS theory and list the formulae for the thermodynamic quantities of this theory in the usual real-time representation. We also represent these formulae in the alternate imaginary-time representation, which makes 'hands-on' numerical evaluation of the thermodynamic quantities of interest readily accessible. Finally, we pointout the limitations of the BCS theory and describe some of its proposed extensions for describing the behavior of some of the new, unconventional superconductors.
