The European College of Neuropsychopharmacology (ECNP) is a scientific and educational association which represents a variety of disciplines. The first ECNP congress took place in Copenhagen, May 1985, where a working group of European scientists within the field of psychopharmacology was elected to prepare a constituent ECNP congress in Brussels, 1987. Among the most active members of this group was Max Hamilton. At the second ECNP congress in Brussels Max Hamilton was elected as the first honorary member of the ECNP. When we received the message of his death we decided at once to arrange a Max Hamilton memorial symposium at the third ECNP congress, May 1989, in Gothenburg, Sweden. This monograph contains the proceedings of the Max Hamilton

symposium which was chaired by the editors. The opening lecture of the third ECNP congress was a Max Hamilton lecture: "A life devoted to science in psychiatry" which was presented by Sir Martin Roth. It seemed obvious to include Sir Martin's lecture as the opening article of this monograph. Although G .E. Berrios was unable to participate in the ECNP congress we have found it logical to include his manuscript on "The Hamilton Depression Scale and the Numerical Description of the Symptoms of Depression" as another personal contribution to Max Hamilton and his rating scales. The aim of this encyclopedia is to provide a comprehensive reference work on scientific and other scholarly research on the quality of life, including health-related quality of life research or also called patient-reported outcomes research. Since the 1960s two overlapping but fairly distinct research communities and traditions have developed concerning ideas about the quality of life, individually and collectively, one with a fairly narrow focus on health-related issues and one with a quite broad focus. In many ways, the central issues of these fields have roots extending to the observations and speculations of ancient philosophers, creating a continuous exploration by diverse explorers in diverse historic and cultural circumstances over several centuries of the qualities of human existence. What we have not had

so far is a single, multidimensional reference work connecting the most salient and important contributions to the relevant fields. Entries are organized alphabetically and cover basic concepts, relatively well established facts, lawlike and causal relations, theories, methods, standardized tests, biographic entries on significant figures, organizational profiles, indicators and indexes of qualities of individuals and of communities of diverse sizes, including rural areas, towns, cities, counties, provinces, states, regions, countries and groups of countries.

Poor clinical trial designs result in failed studies wasting research funds and limiting the advancement of cures for disorders. *Clinical Trial Design Challenges in Mood Disorders* outlines classic problems researchers face in designing clinical trials and discusses how best to address them for the most definitive and generalizable results.

Traditional trial designs are included as well as novel analytic techniques. The book examines information on high placebo response, the generalizability of studies conducted in the developing world, the duration of maintenance studies, and the application of findings into clinical practice. With representation from contributors throughout the world and from academia, industry, regulatory agencies, and advocacy groups, this book will contribute toward improved clinical trial design and valid, precise, and reliable answers about what works better and faster for patients. - Summarizes common trial design problems and their solutions - Encompasses funding, subject selection, regulatory issues and more - Identifies best practices for definitive and generalizable results - Includes traditional trial designs and novel analytic techniques - Represents academia, industry, regulatory agencies, and advocacy groups

Handbook of Psychological Assessment Oxford University Press

"The reliability and validity of information obtained from any psychological test is dependent on the scope and psychometric attributes of the instrument used. As in all areas of science, what psychologists discover depends on

the quality of the instruments used and the information they provide as well as skillful interpretation of the test results. Better conceptualized instruments yield more accurate and informative data than do weaker instruments. Instruments that uncover more useful information about the individual being examined are more valid and ultimately better inform both researchers and clinicians. The tools school psychologists choose for diagnostic decision making substantially influence the reliability and validity of the information they obtain and the decisions they make. Simply put, the better the tool is, the more valid and reliable the decisions; the more useful the information obtained is, the better the services provided. In this chapter, some important issues regarding quality and effectiveness of the tools used in school psychology are discussed"--Book. (PsycINFO Database Record (c) 2013 APA, all rights reserved).

Over a century ago, psychologists who were fascinated with religion began to study and write about it. Theologians and religious practitioners have responded to this literature, producing a fascinating dialogue that deals with our fundamental understandings about the human person and our place in the world. This book provides an introduction to the important conversations that have developed out of these interchanges. The dialogue between psychology and religion is difficult to study for a number of reasons. First, it requires knowledge of both psychology and religion. People with a background in psychology often lack a solid understanding of the religious traditions they wish to study, and theologians may not be up to date on the latest developments in psychology. Second, it requires conceptual tools to organize the material and understand the basic problems involved in any attempt to connect the science of psychology with religion. These concepts can be found in many places, for instance in the writings of philosophers of science, but they are complex and often hard to follow for those without a proper theological and philosophical background. Finally, authors who write on the topic come to the study of psychology and religion from a variety of academic and personal backgrounds. This makes for wonderful diversity in conversations, but it makes understanding and mastery of the material quite difficult.

This Handbook provides a contemporary and research-informed review of the topics essential to clinical psychological assessment and diagnosis. It outlines assessment issues that cross all methods, settings, and disorders, including (but not

limited to) psychometric issues, diversity factors, ethical dilemmas, validity of patient presentation, psychological assessment in treatment, and report writing. These themes run throughout the volume as leading researchers summarize the empirical findings and technological advances in their area. With each chapter written by major experts in their respective fields, the text gives interpretive and practical guidance for using psychological measures for assessment and diagnosis.

Beck Depression Inventory (BDI-II), Second Edition. San Antonio, TX American Psychological Association (APA)

New trends in mental healthcare practice and a rapid increase in the aged population are causing an explosion in the fields of clinical gerontology and geropsychology today. This comprehensive second edition handbook offers clinicians and graduate students clear guidelines and reliable tools for assessing general mental health, cognitive functioning, functional age, psychosocial health, comorbidity, behavior deficits, and more.

Psychopathology, behavioral disorders, changes in cognition, and changes in everyday functioning are addressed in full, and a wide range of conditions and disorders common to this patient population are covered. Each chapter provides an empirical review of assessment instruments, assessment scales in their totality, a review of how these instruments are used with and adapted for different cultural groups, illustration of assessments through case studies, and information on how to utilize ongoing assessment in treatment and/or treatment planning. This combination of elements will make the volume the definitive assessment source for clinicians working with elderly patients. - The most comprehensive source of up-to-date data on gerontological assessment, with review articles covering: psychopathology, behavioral disorders, changes in cognition, and changes in everyday functioning - Consolidates broadly distributed literature into single source, saving researchers and clinicians time in obtaining and translating information and improving the level of further research and care they can provide -

Chapters directly address the range of conditions and disorders most common for this patient population - i.e. driving ability, mental competency, sleep, nutrition, sexual functioning, demntias, elder abuse, depression, anxiety disorders, etc - Fully informs readers regarding conditions most commonly encountered in real world treatment of an elderly patient population - Each chapter cites case studies to illustrate assessment techniques - Exposes reader to real-world application of each assessment discussed

Providing conceptual and practical foundations in scale construction and psychometrics for producers and consumers of social/personality research, this guide covers basic principles, practices, and processes in scale construction, scale evaluation, scale use, and interpretation of research results in the context of psychological measurement. It explains fundamental concepts and methods related to dimensionality, reliability, and validity. In addition, it provides relatively non-technical introductions to special topics and advanced psychometric perspectives such as Confirmatory Factor Analysis, Generalizability Theory, and Item Response Theory. The SAGE Library in Social and Personality Psychology Methods provides students and researchers with an understanding of the methods and techniques essential to conducting cutting-edge research. Each volume within the Library explains a specific topic and has been written by an active scholar (or scholars) with expertise in that particular methodological domain. Assuming no prior knowledge of the topic, the volumes are clear and accessible for all readers. In each volume, a topic is introduced, applications are discussed, and readers are led step by step through worked examples. In addition, advice about how to interpret and prepare results for publication are presented.

Handbook of Assessment in Clinical Gerontology Academic Press

The field of psychological assessment has been undergoing rapid change. The second edition of this Handbook, published in 1990, appeared at the beginning of a decade marked by extensive advances in assessment in essentially all of its specialized areas. There are many new tests, new applications of established tests, and new test systems. Major revisions

have appeared of established tests, notably the Wechsler intelligence scales. The time seemed right for a third edition, since even over the relatively brief period of ten years, many tests described in the second edition have been replaced, and are no longer commonly used. Furthermore, much new research in such areas as neuropsychology, cognitive science, and psychopathology have made major impacts on how many tests and other assessment procedures are used and interpreted. This third edition represents an effort to give the reader an overview of the many new developments in assessment, while still maintaining material on basic psychometric concepts in order for it to continue to serve as a comprehensive handbook for the student and professional.

This report is designed to raise the profile of mental illness in Canada among government & non-governmental organizations and the industry, education, workplace, & academic sectors. It describes major mental illnesses and outlines their incidence & prevalence, causation, impact, stigma, and prevention & treatment. Data presented are based on currently available provincial studies & data on mortality and hospitalizations. Five mental illnesses have been selected for inclusion in the report by virtue of their high prevalence rates or because of the magnitude of their health, social, & economic impact: mood disorders, schizophrenia, anxiety disorders, personality disorders, and eating disorders. While not in itself a mental illness, suicidal behaviour is also included since it is highly correlated with mental illness and raises many similar issues. The appendix includes information on data sources and a call for action on building consensus for a national action plan on mental illness & mental health.

APA Handbook of Testing and Assessment in Psychology: Testing and assessment in school psychology and education
Springer Science & Business Media

Test-based psychological assessment has been significantly affected by the health care revolution in the United States during the past two decades. Despite new limitations on psychological services across the board and psychological testing in particular, it continues to offer a rapid and efficient method of identifying problems, planning and monitoring a course of treatment, and assessing the outcomes of interventions. This thoroughly revised and greatly expanded third edition of a classic reference, now three volumes, constitutes an invaluable resource for practitioners who in a managed care era need to focus their testing not on the general goals of personality assessment, symptom identification, and diagnosis so often presented to them as students and trainees, but on specific questions: What course of treatment should this person receive? How is it going? Was it effective? New chapters describe new tests and models and

new concerns such as ethical aspects of outcomes assessment. Volume I reviews general issues and recommendations concerning the use of psychological testing for screening for psychological disturbances, planning and monitoring appropriate interventions, and the assessing outcomes, and offers specific guidelines for selecting instruments. It also considers more specific issues such as the analysis of group and individual patient data, the selection and implementation of outcomes instrumentation, and the ethics of gathering and using outcomes data. Volume II discusses psychological measures developed for use with younger children and adolescents that can be used for the purposes outlined in Volume I; Volume III, those developed for use with adults. Drawing on the knowledge and experience of a diverse group of leading experts--test developers, researchers, clinicians and others, the third edition of *The Use of Psychological Testing for Treatment Planning and Outcomes Assessment* provides vital assistance to all clinicians, and to their trainees and graduate students.
