Air Emissions from Animal Feeding Operations: Current Knowledge, Future Needs discusses the need for the U.S. Environmental Protection Agency to implement a new method for estimating the amount of ammonia, nitrous oxide, methane, and other pollutants emitted from livestock and poultry farms, and for determining how these emissions are

dispersed in the atmosphere. The committee calls for the EPA and the U.S. Department of Agriculture to establish a joint council to coordinate and oversee short - and long-term research to estimate emissions from animal feeding operations accurately and to develop mitigation strategies. Their recommendation was for the joint council to focus its efforts first on those pollutants that pose the greatest risk to the environment and public health.

To most effectively "sell the hay," it is important to evaluate the best balance between what is profitable and beneficial. This record book is helpful to farmers utilizing a grass-hay operation whose primary focus is on maintaining the quantity and quality of the grasses to be sold for profitability. This standard annual record book consists of enough space to record up to 10 grass, hay and pasture fields. In the past, old-timer's relied on visual inspection of the colors, the varying shades of green, or brown, in the fields themselves to determine the need for fertilization. They also visually inspected the growing grasses, and developing seed

---

heads, to determine the times to cut, or mow, the grasses in the hay fields. This record book offers a consistent written method of record keeping beneficial to the modern day farmer. This record book was created for the farmer and tax preparer, providing a basic, time efficient, record-keeping log book compatible with the Schedule F (Form 1040), "Profit or Loss From Farming" form.

Air Emissions from Animal Feeding Operations Createspace Independent Publishing Platform Excerpt from Farmer's Cyclopeda, Vol. 4 of 7: Abridged Agricultural Records From the Publications of the United States Department of Agriculture and the

Experiment Stations; Grass, Hay, Grains, Vegetables No other region has so large a number of useful grasses and forage plants as the United States and Canada. There are within the United States alone no less than 60 native species of clover, 70 of blue grasses, 25 of grammas and curly mesquite grasses which have produced more beef and mutton than all the cultivated hay grasses put together, 90 lupines, 20 wild beans, 40 vetches and an equal number of forage beggar weeds, 20 kinds of wild rye, 30 kinds of brome grasses, besides meadow, pasture, woodland and swamp grasses without number, each kind adapted to a particular soil or climate {ind to some special use. Among the leading grasses are the following: Timothy - This grass, botanically known as Phleum pratense, is supposed to have been introduced from Europe, but the earliest account of its culture is that given by Jared Elliot (special Bul. U. S. Dept. Agr. Who says it was found by a Mr. Timothy Herd in a swamp in New Hampshire, and that he began its cultivation. As it was found to be a valuable grass, its cultivation soon spread, and it was originally known as Herd's grass. It was not introduced into cultivation in England until some fifty years later. It is very probable that the specimens found by Mr. Herd were of

---

native growth, for it is believed to be native in the White Mountains, in the Rocky Mountains, in Alaska and in Labrador. It is also a native of Europe.
