Designed to engage students and lower their "fear factor", Integrative Statistics for the Social and Behavioral Sciences is a concise, user-friendly text that prepares students to use statistics in the real world. Providing depth and breadth of statistical tests, the text focuses on choosing the appropriate statistical analysis, and shows how to interpret the output and present the results. Basic descriptive statistics, hypothesis testing, and basic inferential statistics are covered along with more advanced topics such as correlation, regression, non-parametric statistics, multivariate statistics, and

general linear modeling. The authors emphasize choosing the appropriate statistical test through conceptual material, assumptions, homework exercises, and a helpful "choose-the-appropriate-test" flowchart. They focus on the interpretation of results from both Excel and SPSS outputs, and also demonstrate how to do important calculations by hand to help students grasp the underlying concepts. The book includes end-of-chapter exercises that help students fully grasp the content of each chapter.

Behavioral correlates of hormones, emphasized by psychologists, have captured

the attention of economists in the past years. Behavioral economists, in particular, have investigated the possible roles of hormones on economic decision making and behavior as well as social preferences and cognitive abilities. Testosterone, oxytocin, dopamine, serotonin and stress hormones are the foremost studied ones in economic contexts. Yet, the results are mixed and the relationship between hormones and economic behavior is under-investigated to this date. Hormone levels are measurable and manipulatable (e.g. activate, de-activate, block).

The fact that the behavioral economics also employs experimental methodology makes it possible to observe both correlational and causal relationships between hormones and economic behavior. Since numerous environmental, social and biological factors interact with hormone fluctuations, capturing the true impacts of hormones on decisions and behavior is challenging. Manipulating hormone levels in the body is a method that is used to tackle this issue. Such studies compare observed behaviors of hormones or placebo administrated participants to

determine causal relationships. This Research Topic welcomes the studies on the direct or indirect correlates of hormones on economic behavior and decision making to create new insights on the economic consequences of endocrine activity.

"Cop Doc's Guide to Public Safety Complex Trauma Syndrome" is written in response to the

need for an advanced, specialized guide for clinicians to operationally define, understand, and responsibly treat complex post-traumatic stress and grief syndromes in the context of the unique varieties of police personality styles. The book continues where Rudofossi's first book, "Working with Traumatized Police Officer Patients", left off. Theory is wed to practice and practice to effective interventions with police officer-patients. The 'how' and 'why' of a clinician's approach is made highly effective by understanding the distinct personality styles of officer-patients. Rudofossi's theoretical approach segues into difficult examples that highlight each officer-patient's eco-ethological field experience of loss in trauma, with a focus on enhancing resilience and motivation to - otherwise left disenfranchised. Thus, this original work expands the ecological-ethological existential analysis of complex PTSD into the context of personality styles, with an emphasis on resilience - without ignoring the pathological aspects of loss that often envelop officer-

patient trauma syndromes.
