Possibly the most complete book written to date on helicopters and helicopter flying. Covers subjects not covered by other manuals such as turbine engines, performance, flight manuals, automatic flight controls, legal aspects, introductory stability and control and multi-engine helicopters.

The Art and Science of Flying Helicopters Skyhorse Publishing Inc.

The first book devoted solely to the subject of landing a helicopter without engine power. It covers the basics, as seen from the cockpit of the helicopter, and is written from the pilot's perspective. It covers the subject for both the student helicopter pilot and the helicopter flight instructor. Training exercises are developed, starting from the very beginning through to how to adjust the flight path to arrive at a particular spot. The Height-Velocity curve and it's development are covered. There are few formulae, and many diagrams. The text has been developed from the author's experience teaching autorotations at a major manufacturer's training school as well teaching student test pilots about the height-velocity diagram while instructing at three different test pilot schools. It is also based on his experience as an engineering test pilot at Transport Canada.

The U.S. Border patrol is procuring a new type of helicopter--the MD 600N--to replace its aging helicopter fleet. The MD 600N is expected to meet various air operations requirements, such as low and slow surveillance and transport of agents. This report provides information and analysis on the MD 600N procurement and whether the MD 600N has been effective in safely supporting the Border Patrol's primary air operations mission. Most Border Patrol pilots experienced in flying the MD 600N and most sector chiefs had strong reservations about the helicopter's suitability for key missions. The pilots were also concerned with the aircraft's safety, citing difficulty in performing emergency maneuvers. Two of the three law enforcement agencies with MD 600Ns that GAO spoke with shared many of the same concerns. GAO recommends that INS: (1) address issues raised by pilots and mechanics before buying more MD 600Ns; and (2) reassess its purchase decision. The National Wildfire Coordinating Group provides national leadership to enable interoperable wildland fire operations among federal, state, local, tribal, and territorial partners. Primary objectives include: Establish national interagency wildland fire operations standards. Recognize that the decision to adopt standards is made independently by the NWCG members and communicated through their respective directives systems; Establish wildland fire position standards, qualifications requirements, and performance support capabilities (e.g. training courses, job aids) that enable implementation of NWCG standards; Support the National Cohesive Wildland Fire Management Strategy goals: to restore and maintain resilient landscapes; create fire adapted communities; and respond to wildfires safely and effectively; Establish information technology (IT) capability requirements for wildland fire; and Ensure that all NWCG activities contribute to safe, effective, and coordinated national interagency wildland fire operations. The objectives of the "Interagency Helicopter Operations Guide" (IHOG) are to: Promote safe, cost-efficient and effective aviation services in support of agency and interagency goals and objectives; Define and standardize national, interagency helicopter management and operational procedures for helicopter users from participating agencies; Through standardization, facilitate the ability of personnel from different agencies to work cooperatively on incidents or projects; and Provide a framework within which areas, regions, states, and local units can provide supplemental, site-specific guidance. The procedures contained in this guide apply to helicopter operations conducted by providers and users of helicopters from participating agencies. This guide addresses both incident and resource helicopter operations.

Ultrasound has rapidly become integral to the practice of emergency medicine. Over the past few years, with improvements in device size and cost, there has been increasing interest in exploring the utility of ultrasound in the prehospital environment. Much of the available literature on ultrasound in the emergency setting focuses on care delivered in emergency departments and intensive care units within the developed world. As a result, most resources are inappropriate and inadequate for doctors and non-physicians practicing in out-of-hospital environments that, by definition, are resource limited. This manual fills that gap by focusing on simplified discussions of ultrasound studies, ultrasound physics, and research that impacts out-of-hospital care in order to meet the needs of prehospital and austere providers. The manual discusses the use of ultrasound for diagnosis in out-of-hospital care, advanced noninvasive monitoring of patients, and safety in performing procedures common to the prehospital and austere environment. As is the approach for prehospital education, the chapters are complaint based and not diagnosis based where applicable. Chapters cover ultrasound image interpretation and basic physics; common image adjustments to improve image quality; unique challenges found in urban prehospital environments, austere/wilderness environments, tactical environments, and military special operations environments; and initial training, quality improvement/assurance programs, and credentialing. It also includes a section on procedures such as pericardiocentesis, vascular access, cricothyroidotomy, and others specific to austere providers. The Manual of Austere and Prehospital Ultrasound is an essential resource for physicians and related professionals, residents, and medical students in emergency medicine, civilian and military EMS providers, and critical care flight paramedics and nurses.
