Berkeley DB produces transaction logs that can be used to reconstruct changes from a given point in time. For example, if an administrator were willing to only lose one hour's worth of changes, they could take down the server in the middle of the night, copy the Berkeley database files offsite, and bring the server back online.

Berkeley DB enables the development of custom data management solutions, without the overhead traditionally associated with such custom projects. Berkeley DB provides a collection of well-proven building-block technologies that can be configured to address any application need from the hand-held device to the data center, from a local storage solution to a world-wide distributed one, from kilobytes to petabytes.

Because Berkeley DB is an embedded database, efficient caching of stored raw record data is performed by the database library. The SampleViews class is used to create the bindings and collections. This class is separate from the SampleDatabase class to illustrate the idea that a single set of stored data can be accessed via multiple bindings and collections, or views.

Berkeley DB Java Edition is a single JAR file that runs in the same JVM as your application, so there is no remote server. A local cache keeps the most active data in memory, avoiding costly disk access, and bounds the usage of JVM memory to a predictable amount. Local, in-process data storage Schema-neutral, application native data storage

The Berkeley DB XML database specializes in the storage of XML documents, supporting XQuery via XQilla. It is implemented as an additional layer on top of (a legacy version of) Berkeley DB and the Xerces library. DB XML is written in C++ and supports multiple language bindings, including C++, Java (via JNI), Perl and Python. *Berkeley DB, Java Edition Collections Tutorial - Oracle ...*
