The Travel and Tropical Medicine Manual John Wiley & Sons

This book has been developed as a forest inventory textbook for students and could also serve as a handbook for practical foresters. We have set out to keep the mathematics in the book at a fairly non-technical level, and therefore, although we deal with many issues that include highly sophisticated methodology, we try to present first and foremost the ideas behind them. For foresters who need more details, references are given to more advanced scientific papers and books in the fields of statistics and biometrics. Forest inventory books deal mostly with sampling and measurement issues, as found here in section I, but since forest inventories in many countries involve much more than this, we have also included material on forestry applications. Most applications nowadays involve remote sensing technology of some sort, so that section II deals mostly with the use of remote sensing material for this purpose. Section III deals with national inventories carried out in different parts of world, and section IV is an attempt to outline some future possibilities of forest inventory methodologies. The editors, Annika Kangas Professor of Forest Mensuration and Management, Department of Forest Resource Management, University of Helsinki. Matti Maltamo Professor of Forest Mensuration, Faculty of Forestry, University of Joensuu. ACKNOWLEDGEMENTS

This volume arose from an attempt to find a new way to approach the shrimp aquaculture's future, facing up to the central insight that a global, technology-driven blue revolution will require new forms of governance to match the technological and social changes brought by innovative aquaculture practices. Each chapter contains evidence-based background information emphasizing core science, intended for the professional who already possesses a basic understanding of the principles of shrimp aquaculture and layout of each chapter includes a table of contents, materials and methodologies and a concluding set of objectives of the experimental study for the better understanding of the subject matter to the readers. The aim of this book is to provide a basic understanding of the modern culture techniques currently used in shrimp aquaculture research, primarily for vannamei, such that readers can develop an understanding of both the power and limitations of Intensive systems. Recently, in the scientific literature, there has been a profusion of information pertaining to many advanced culture systems such as raceways, recirculatory aquaculture systems and many advanced culture practices such as biofloc technology and probiotics based culture practices. The material covered in the chapters of this book provides background to newcomers interested in Intensive shrimp culture techniques and a description of the current state of research and scientific understanding of advanced systems and standard management practices in regards to environmental sustainability of shrimp aquaculture would be much more helpful for the farmers and the industrial stakeholders. For researchers currently working in the field on specific culture systems and practices this text provides invaluable information that relates innovative intensive culture systems. Note: T&F does not sell or distribute the Hardback in India, Pakistan, Nepal, Bhutan, Bangladesh and Sri Lanka.

First Published in 2018. This book grew out of a course of lectures given to third year undergraduates at Oxford University and it has the modest aim of producing a rapid introduction to the subject. It is designed to be read by students who have had a first elementary course in general algebra. On the other hand, it is not intended as a substitute for the more voluminous tracts such as Zariski-Samuel or Bourbaki. We have concentrated on certain central topics, and large areas, such as field theory, are not touched. In content we cover rather more ground than Northcott and our treatment is substantially different in that, following the modern trend, we put more emphasis on modules and localization.

In a rapidly changing world, there is an ever-increasing need to monitor the Earth's resources and manage it sustainably for future generations. Earth observation from satellites is critical to provide information required for informed and timely decision making in this regard. Satellite-based earth observation has advanced rapidly over the last 50 years, and there is a plethora of satellite sensors imaging the Earth at finer spatial and spectral resolutions as well as high temporal resolutions. The amount of data available for any single location on the Earth is now at the petabyte-scale. An ever-increasing capacity and computing power is needed to handle such large datasets. The Google Earth Engine (GEE) is a cloud-based computing platform that was established by Google to support such data processing. This facility allows for the storage, processing and analysis of spatial data using centralized high-power computing resources, allowing scientists, researchers, hobbyists and anyone else interested in such fields to mine this data and understand the changes occurring on the Earth's surface. This book presents research that applies the Google Earth Engine in mining, storing, retrieving and processing spatial data for a variety of applications that include vegetation monitoring, cropland mapping, ecosystem assessment, and gross primary productivity, among others. Datasets used range from coarse spatial resolution data, such as MODIS, to medium resolution datasets (Worldview -2), and the studies cover the entire globe at varying spatial and temporal scales.
