Hypothesis tests: binomial distribution ...
In a binomial distribution the probabilities of interest are those of receiving a certain

number of successes, r , in n independent trials each having only two possible outcomes and the same probability, p , of success. So, for example, using a binomial distribution, we can determine the probability of getting 4 heads in 10 coin tosses.

The probability distribution of a binomial random variable is called a binomial distribution.

Suppose we flip a coin two times and count the number of heads (successes). The binomial random variable is the number of heads, which can take on values of 0, 1, or 2. The binomial distribution is presented below.

Mean and Variance of Binomial Distribution. If p is the probability of success and q is the probability of failure in a binomial trial, then the expected number of successes in n trials (i.e. the mean value of the binomial distribution) is. $E(X) = ? = np$. The variance of the binomial distribution is. $V(X) = ?^2 = npq$
