It isn't just in recent arguments over the teaching of intelligent design or reciting the pledge of allegiance that religion and education have butted heads: since their beginnings nearly two centuries ago, public schools have been embroiled in heated controversies over religion's place in the education system of a pluralistic nation. In this book, Benjamin Justice and Colin Macleod take up this rich and significant history of conflict with renewed clarity and astonishing breadth. Moving from the American Revolution to the present—from the common schools of the nineteenth century to the charter schools of the twenty-first—they offer one of the most comprehensive assessments of religion and education in America that has ever been published. From Bible readings and school prayer to teaching evolution and cultivating religious tolerance, Justice and Macleod consider the key issues and colorful characters that have shaped the way American schools have attempted to negotiate religious pluralism in a politically legitimate fashion. While schools and educational policies have not always advanced tolerance and understanding, Justice and Macleod point to the many efforts Americans have made to find a place for religion in public schools that both acknowledges the importance of faith to so many citizens and respects democratic ideals that insist upon a reasonable separation of church and state. Finally, they apply the lessons of history and political philosophy to an analysis of three critical areas of religious controversy in public education today: student-led religious observances in extracurricular activities, the tensions between freedom of expression and the need for inclusive environments, and the shift from democratic control of schools to loosely regulated charter and voucher programs. Altogether Justice and Macleod show how the interpretation of educational history through the lens of contemporary democratic theory offers both a richer understanding of past disputes and new ways of addressing contemporary challenges.

Communicating the History of Medicine critically assesses the idea of audience and communication in medical history. This collection offers a range of case studies on academic outreach from historical and current perspectives. It questions the kind of linear thinking often found in policy or research assessment, instead offering a more nuanced picture of both the promises and pitfalls of engaging audiences for research in the humanities. For whom do academic researchers in the humanities write? For academics and, indirectly, at least for students, but there are hopes that work reaches broader audiences and that it will have an impact on policy or among professional experts outside of the humanities. Today impact is more and more discussed in the context of research assessment. Seen from a media theoretical perspective, impact may however be described as a case of 'audiencing' and the creation of audiences by means of media technologies.

Why do some parents refuse to vaccinate their children? Why do some people keep guns at home, despite scientific evidence of risk to their family members? And why do people use antibiotics for illnesses they cannot possibly alleviate? When it comes to health, many people insist that science is wrong, that the evidence is incomplete, and that unidentified hazards lurk everywhere. In *Denying to the Grave*, Gorman and Gorman, a father-daughter team, explore the psychology of health science denial. Using several examples of such denial as test cases, they propose six key principles that may lead individuals to reject "accepted" health-related wisdom: the charismatic leader; fear of complexity; confirmation bias and the internet; fear of corporate and government conspiracies; causality and filling the ignorance gap; and the nature of risk prediction. The authors argue that the health sciences are especially vulnerable to our innate resistance to integrate new concepts with pre-existing beliefs. This psychological difficulty of incorporating new information is on the cutting edge of neuroscience research, as scientists continue to identify brain responses to new information that reveal deep-seated, innate discomfort with changing our minds. *Denying to the Grave* explores risk theory and how people make decisions about what is best for them and their loved ones, in an effort to better understand how people think when faced with significant health decisions. This book points the way to a new and important understanding of how science should be conveyed to the public in order to save lives with existing knowledge and technology.

What are you? Obviously, you are a person with human ancestors that can be plotted on a family tree, but you have other identities as well. According to evolutionary biologists, you are a member of the species *Homo sapiens* and as such have ancestral species that can be plotted on the tree of life. According to microbiologists, you are a collection of cells, each of which has a cellular ancestry that goes back billions of years. A geneticist, though, will think of you primarily as a gene-replication machine and might produce a tree that reveals the history of any given gene. And finally, a physicist will give a rather different answer to the identity question: you can best be understood as a collection of atoms, each of which has a very long history. Some have been around since the Big Bang, and others are the result of nuclear fusion that took place within a star. Not only that, but most of your atoms belonged to other living things before joining you. From your atoms' point of view, then, you are just a way station on a multibillion-year-long journey. *You: A Natural History* offers a multidisciplinary investigation of your hyperextended family tree, going all the way back to the Big Bang. And while your family tree may contain surprises, your hyperextended history contains some truly amazing stories. As the result of learning more about who and what you are, and about how you came to be here, you will likely see the world around you with fresh eyes. You will also become aware of all the one-off events that had to take place for your existence to be possible: stars had to explode, the earth had to be hit 4.5 billion years ago by a planetesimal and 65 million years ago by an asteroid, microbes had to engulf microbes, the African savanna

had to undergo climate change, and of course, any number of your direct ancestors had to meet and mate. It is difficult, on becoming aware of just how contingent your own existence is, not to feel very lucky to be part of our universe.

How do people come up with truly original ideas? The answer is to think outside the box—way outside. For the past decade, Cyril Bouquet, Jean-Louis Barsoux, and Michael Wade, professors of innovation and strategy at IMD Business School, have studied inventors, scientists, doctors, entrepreneurs, and artists. These people, or "aliens," as the authors call them, are able to make leaps of creativity, and use five patterns of thinking that distinguish them from the rest of us. These five patterns—Attention, Levitation, Imagination, Experimentation, and Navigation—lead to a fresh and flexible approach to problem-solving. Alien thinkers know how to free the imagination so it can detect hard-to-observe patterns. They practice deliberate ways to retreat from the world in order to see the big picture underlying a problem. And they approach ideas in systematic ways that reflect the constraints of reality. Through surprising and compelling stories, the authors show how readers can use this method to develop out-of-this-world ideas. *ALIEN Thinking* can help any of us find innovative solutions to the most difficult problems.

The rapid developments in technologies – especially computing and the advent of many 'smart' devices, as well as rapid and perpetual communication via the Internet – has led to a frequently voiced view which Nicholas Agar describes as 'radical optimism'. Radical optimists claim that accelerating technical progress will soon end poverty, disease, and ignorance, and improve our happiness and well-being. Agar disputes the claim that technological progress will automatically produce great improvements in subjective well-being. He argues that radical optimism 'assigns to technological progress an undeserved pre-eminence among all the goals pursued by our civilization'. Instead, Agar uses the most recent psychological studies about human perceptions of well-being to create a realistic model of the impact technology will have. Although he accepts that technological advance does produce benefits, he insists that these are significantly less than those proposed by the radical optimists, and aspects of such progress can also pose a threat to values such as social justice and our relationship with nature,

while problems such as poverty cannot be understood in technological terms. He concludes by arguing that a more realistic assessment of the benefits that technological advance can bring will allow us to better manage its risks in future.

4th Refuting the Myth of Evolutionism and Exposing the Folly of Clergy Letters The Darwinian theory of evolution begins with facts (science of microevolution) and ends with fiction (myths of macroevolution). The myths are part of our experience, no transitional organisms in the living world, and part of our discoveries, no transitional fossils in such deposits at the Burgess Shale and Chengjiang sites, where various kinds of organisms appear together in large collection. In his fourth book, Refuting the Myth of Evolutionism and Exposing the Folly of Clergy Letters, author, Michael Ebifegha, stresses that real science is timeless and based on events that are directly or indirectly observable, testable, and repeatable. Challenging evolutionists and their clerical allies who are banning the teaching of creationism in public schools, Ebifegha insists that evolutionism is also outside sciences purview and, therefore, should be banned as well. He reprimands clerics for capitalizing on human knowledge but failing to recognize the validity of Gods personal claim in speech before an audience and in print on stone tablets for having created the world. These interventions, he asserts, fulfills the worlds standard legal requirement for inventors. Ebifegha argues that the inconsistency of imposing evolutionism as scientific truth on the public and banning creationism violates (1) the academic rights of accomplished scientists who disagree with evolutionism on scientific grounds; (2) the US Supreme Courts 1992 declaration, At the heart of liberty is the right to define ones own concept of existence, of meaning, of the universe, and of the mystery of human life; and (3) Gods historical claim to ownership of the universe. Instead of separation of church and state, Ebifegha recommends separation of worldviews and state.

The essential guide by one of America's leading doctors to how digital technology enables all of us to take charge of our health A trip to the doctor is almost a guarantee of misery. You'll make an appointment months in advance. You'll probably wait for several hours until you hear "the doctor will see you now"-but only for fifteen minutes! Then you'll wait even longer for lab tests, the results of which you'll likely never see, unless they indicate further (and more invasive) tests, most of which will probably prove unnecessary (much like physicals themselves). And your bill will be astronomical. In *The Patient Will See You Now*,

Eric Topol, one of the nation's top physicians, shows why medicine does not have to be that way. Instead, you could use your smartphone to get rapid test results from one drop of blood, monitor your vital signs both day and night, and use an artificially intelligent algorithm to receive a diagnosis without having to see a doctor, all at a small fraction of the cost imposed by our modern healthcare system. The change is powered by what Topol calls medicine's "Gutenberg moment." Much as the printing press took learning out of the hands of a priestly class, the mobile internet is doing the same for medicine, giving us unprecedented control over our healthcare. With smartphones in hand, we are no longer beholden to an impersonal and paternalistic system in which "doctor knows best." Medicine has been digitized, Topol argues; now it will be democratized. Computers will replace physicians for many diagnostic tasks, citizen science will give rise to citizen medicine, and enormous data sets will give us new means to attack conditions that have long been incurable. Massive, open, online medicine, where diagnostics are done by Facebook-like comparisons of medical profiles, will enable real-time, real-world research on massive populations. There's no doubt the path forward will be complicated: the medical establishment will resist these changes, and digitized medicine inevitably raises serious issues surrounding privacy. Nevertheless, the result-better, cheaper, and more human health care-will be worth it. Provocative and engrossing, *The Patient Will See You Now* is essential reading for anyone who thinks they deserve better health care. That is, for all of us.

National implementation of the Convention on Biological Diversity (CBD) provisions has yielded enough challenges for providers and users of genetic resources and associated traditional knowledge alike. The Nagoya Protocol brings novel ideas for resolving the challenges plaguing the Access and Benefit-Sharing (ABS) process in general and non-commercial research in particular. This is one of the first books to address research cooperation and facilitated access for non-commercial biodiversity research. It uniquely offers concrete and practicable solutions based on experiences of researchers and administrative officials with ABS, and on the interpretation of the Nagoya Protocol on how free and lively taxonomic research can be ensured while at the same time observing obligations of obtaining prior informed consent and sharing of benefits. This book will be useful to students of International Environmental Law, International

Biodiversity Law, Intellectual Property Law, Climate Law and Law of Indigenous Populations. With foreword from Executive Secretary CBD, Braulio Ferreira de Souza Dias.

On a historical global turning point, this book offers a thorough exploration of the "New Sustainability Paradigm", originally developed by the Global Scenario Group (GSG) of the Stockholm Environmental Institute (SEI) as a starting point for analyzing real-life transitions and transformations. 11 contributors from 5 continents present detailed analyses of economic and political transitions in Western and Eastern Europe, the USA, the Middle East, and in Asia, discussing the role of different players in the implementation of the New Sustainability Paradigm. Part I offers an overview of the six scenarios developed by the GSG and a short discussion of significant papers published by the Great Transition Initiative (GTI) of the Tellus Institute. Next come

examples of dramatic historical and current transitions in Western Europe, the USA, Eastern Europe, the Middle East (Arabian Spring), and Asia, as well as an analysis of the potential of humankind to manage a great transition to the new sustainability paradigm. Subsequent chapters highlight the role of culture and education and review the role of different players for the implementation of the new sustainability paradigm. The focus of Part II is on the ecological pillar of Sustainability. The discussion includes urgent ecological problems including climate engineering, eco-criminality, bioterrorism, biodiversity protection, water, energy, and food security. Part III deals with needed innovations in sustainable waste management and sustainable city architecture, especially big cities in developing and threshold countries, where a significant part of the world population is concentrated. The fourth and final section offers an analysis of insights developed throughout the book, and outlines recommendations for the implementation of the New Sustainability Paradigm by civil society, grass-root movements, scholars, politically neutral NGOs, sincere media players, and by open-minded and enlightened politicians to manage and steer the Great Transition towards sustainable global democracy.
