### Saving Darwin Prentice Hall

A biology professor's illuminating tour of the physical imperfections—from faulty knees to junk DNA—that make us human. ¶“A funny, fascinating catalog of our collective shortcomings that's tough to put down.”—Discover ¶ We humans like to think of ourselves as highly evolved creatures. But if we are supposedly evolution's greatest creation, why do we have such bad knees? Why do we catch head colds so often—two hundred times more often than a dog does? How come our wrists have so many useless bones? Why is the vast majority of our genetic code pointless? And are we really supposed to swallow and breathe through the same narrow tube? Surely there's been some kind of mistake? As professor of biology Nathan H. Lents explains in *Human Errors*, our evolutionary history is indeed nothing if not a litany of mistakes, each more entertaining and enlightening than the last. The human body is one big pile of compromises. But that is also a testament to our greatness: as Lents shows, humans have so many design flaws precisely because we are very, very good at getting around them. A rollicking, deeply informative tour of humans' four-billion-year-and-counting evolutionary saga, *Human Errors* both celebrates our imperfections and offers an unconventional accounting of the cost of our success.

This blistering novel—from the bestselling, Pulitzer Prize – winning author of *The Road*—returns to the Texas-Mexico border, setting of the famed *Border Trilogy*. The time is our own, when rustlers have given way to drug-runners and small towns have become free-fire zones. One day, a good old boy named Llewellyn Moss finds a pickup truck surrounded by a bodyguard of dead men. A load of heroin and two million dollars in cash are still in the back. When Moss takes the money, he sets off a chain reaction of catastrophic violence that not even the law – in the person of aging, disillusioned Sheriff Bell – can contain. As Moss tries to evade his pursuers – in particular a mysterious mastermind who flips coins for human lives – McCarthy simultaneously strips down the American crime novel and broadens its concerns to encompass themes as ancient as the Bible and as bloodily contemporary as this morning ' s headlines. No *Country for Old Men* is a triumph. Biology Pearson Prentice Hall

New York Times Bestseller The beloved actress and star of *One Tree Hill*, *White Collar*, and *Lethal Weapon*, Hilarie Burton Morgan, tells the story of leaving Hollywood for a radically different kind of life in upstate New York with her husband Jeffrey Dean Morgan—a celebration of community, family, and the value of hard work in small town America. While Hilarie Burton Morgan's hectic lifestyle as an actress in New York and Los Angeles gave her a comfortable life, it did not fulfill her spiritually or emotionally. After the birth of their first son, she and her husband Jeffrey Dean Morgan, the star of *The Walking Dead*, decided to make a major change: they bought a working farm in Rhinebeck, New York, and began a new chapter in their lives. The *Rural Diaries* chronicles her inspiring story of farm life: chopping wood, making dandelion wine, building chicken coops. Burton looks back at her transition from urban to country living—discovering how to manage a farm while raising her son and making friends with her new neighbors. She mixes charming stories of learning to raise alpacas and buying and revitalizing the town ' s beloved candy store, Samuel ' s Sweet Shop, with raw observations on the ups and downs of marriage and her struggles with secondary infertility. Burton also includes delicious recipes that can be made with fresh ingredients at home, as well as home renovation and gardening tips. Burton ' s charisma, wide eyed attitude, and fortitude—both internal and physical—propels this moving story of transformation and self-discovery. The *Rural Diaries* honors the values and lifestyle of small-town America and offers inspiration for anyone longing to embark on their own unconventional journey.

### The Edge of Evolution Simon and Schuster

An inspiring book about the power and the passion of science Few have weighed in on the nation's contentious debate over evolution as effectively as Kenneth R. Miller. In *Only a Theory*, Miller—the highly regarded scientist who offered expert testimony at the 2005 trial over the teaching of evolution in Dover, Pennsylvania—eloquently shows how "Intelligent Design" collapses at the very moment one begins to take it seriously. Miller shows that the attack on evolution is a broader assault on the skepticism and reason that have fueled America's remarkable scientific advances, and offers an encouraging prescription for how we can save the nation's "scientific soul" to which we owe so much.

A geneticist discusses the role of DNA in the evolution of life on Earth, explaining how an analysis of DNA reveals a complete record of the events that have shaped each species and how it provides evidence of the validity of the theory of evolution. Only a Theory Benjamin-Cummings Publishing Company When Michael J. Behe's first book, *Darwin's Black Box*, was published in 1996, it launched the intelligent design movement. Critics howled, yet hundreds of thousands of readers -- and a growing number of scientists -- were intrigued by Behe's claim that Darwinism could not explain the complex machinery of the cell. Now, in his long-awaited follow-up, Behe presents far more than a challenge to Darwinism: He presents the evidence of the genetics revolution -- the first direct evidence of nature's mutational pathways -- to radically redefine the debate about Darwinism. How much of life does Darwin's theory explain? Most scientists believe it accounts for everything from the machinery of the cell to the history of life on earth. Darwin's ideas have been applied to law, culture, and politics. But Darwin's theory has been proven only in one sense: There is little question that all species on earth descended from a common ancestor. Overwhelming anatomical, genetic, and fossil evidence exists for that claim. But the crucial question remains: How did it happen? Darwin's proposed mechanism -- random mutation and natural selection -- has been accepted largely as a matter of faith and deduction or, at best, circumstantial evidence. Only now, thanks to genetics, does science allow us to seek direct evidence. The genomes of many organisms have been sequenced, and the machinery of the cell has been analyzed in great detail. The evolutionary responses of microorganisms to antibiotics and humans to parasitic infections have been traced over tens of thousands of generations. As a result, for the first time in history Darwin's theory can be rigorously evaluated. The results are shocking. Although it can explain marginal changes in evolutionary history, random mutation and natural selection explain very little of the basic machinery of life. The "edge" of evolution, a line that defines the border between random and nonrandom mutation, lies very far from where Darwin pointed. Behe argues convincingly that most of the mutations that have defined the history of life on earth have been nonrandom. Although it will be controversial and stunning, this finding actually fits a general pattern discovered by other branches of science in recent decades: The universe as a whole was fine-tuned for life. From physics to cosmology to chemistry to biology, life on earth stands revealed as depending upon an endless series of unlikely events. The clear conclusion: The universe was designed for life.

Only a Theory Springer Science & Business Media

From one of America's best-known biologists, a revolutionary new way of thinking about evolution that shows "why, in light of our origins, humans are still special" (Edward J. Larson, Pulitzer Prize – winning author of *Evolution*). Once we had a special place in the hierarchy of life on Earth—a place confirmed by the literature and traditions of every human tribe. But then the theory of evolution arrived to shake the tree of human understanding to its roots. To many of the most passionate advocates for Darwin's theory, we are just one species among multitudes, no more significant than any other. Even our minds are not our own, they tell us, but living machines programmed for nothing but survival and reproduction. In *The Human Instinct*, Brown University biologist Kenneth R. Miller "confronts both lay and professional misconceptions about evolution" (*Publishers Weekly*, starred review), showing that while evolution explains how our bodies and brains were shaped, that heritage does not limit or predetermine human behavior. In fact, Miller argues in this "highly recommended" (*Forbes*) work that it is only thanks to evolution that we have the power to shape our destiny. Equal parts natural science and philosophy, *The Human Instinct* makes an "absorbing, lucid, and engaging...case that it was evolution that gave us our humanity" (Ursula Goodenough, professor of biology at Washington University in St. Louis).
