Mitosis is the process via which cells divide, producing copies of themselves. Cancer is essentially mitosis that is out of control. Cancer cells do not operate in the same way as other cells in the system they occupy, so they replicate and damage surrounding tissues. Advertisement. When cells divide, the result is generally two identical copies of the original cell.

LAB . MITOSIS AND CANCER

In previous years, biology students would view slides in the lab and analyze data on cancer and mitotic index. (Investigation: Mitosis and Cancer) This at-home activity only looks at the mitosis of onion cells and I plan to add cancer and mitotic index as a separate activity. I used a microscope camera to take photos of onion root slides where students can count the number of cells in each phase and use those numbers to calculate the amount of time spent in each.

MITOSIS AND CANCER One of the basic

tenets of biology is that all new cells come from living cells. New cells are formed by the

process of cell division which includes both the division of the cell's nucleus (mitosis) and the

division of the cells cytoplasm (cytokinesis).

Mitotic nuclear division typically rests in new

somatic (body) cells.
