\*\*\*\* A must have book for every cancer patient \*\*\*\*THIRD REVISED EDITION NEW CHAPTERS ADDED\*\*\*\* This book provides both an introduction of Dr. Budwig's cancer research and treatment. Johanna Budwig (1908-2003) who was nominated for the Nobel Prize seven times was one of Germany's leading scientists of the 20th Century, a biochemist and Cancer specialist with a special interest in essential fats. Otto Warburg proved that prime cause of cancer oxygen-deficiency in the cells. In absence of oxygen cells ferment glucose to produce energy, lactic acid is formed as a byproduct of fermentation. He postulated that sulfur containing protein and some unknown fat is required to attract oxygen in the cell. In 1951 Dr. Budwig developed Paper Chromatography to identify fats. With this technique she proved that electron rich highly unsaturated Linoleic and Linolenic fatty acids were the undiscovered mysterious decisive fats in respiratory enzyme function that Otto Warburg had been unable to find. She studied the electromagnetic function of pi-electrons of the linolenic acid in the membranes of the microstructure of protoplasm, for all nerve function, secretions, mitosis, as well as cell breakdown. This immediately caused lot of excitement in the scientific community. New doors could open in Cancer research. Hydrogenated fats, including all Trans fatty acids were proved as respiratory poisons. Then Budwig decided to have human trials and gave flaxseed oil and quark to cancer patients. After three months, the patients began to improve in health and strength, the yellow green substance in their blood began to disappear, tumors gradually receded and at the same time the nutrients began to rise. This way Dr. Budwig had found a cure for cancer. It was a great victory and first milestone in the battle against cancer. Her treatment protocol is based on the consumption of flax seed oil with low fat cottage cheese, raw organic diet, mild exercise, and the healing powers of the sun. She treated approx. 2500 cancer patients during a 50 year period with this protocol till her death with over 90% documented success. She was nominated 7 times for Nobel Prize but with a condition that she will use chemotherapy and radiotherapy with her protocol. They did not want to collapse the 200 billion business over night. She always refused to support the damaging chemo and radio for the sake of humanity. Lothar Hirneise - Great supporter of Budwig Protocol. Lothar Hirneise is founder and President of People Against Cancer, Germany. He travels a lot in search of finding most successful alternative cancer therapies. He has been student of Dr. Johanna Budwig. He is a great researcher and writer on alternative healing. He is successfully treating thousands of cancer patients at his 3-E center in Germany. In the last few years he has interviewed several hundred final stage so-called survivors, meaning patients who were in the final stage of cancer and who are all healthy again today. Based on his findings he proposed a 3 E Program - The Mnemonic of Cancer Treatment. 1) Eat well 2) Eliminate 3) Energy. He noticed that 100% of all survivors, did the energy work. In approximately - say 80% of all patients, He found a change in diet. And in at least 60% of all patients, took intensive detoxification rituals. This is the basis of his, so much talked about 3E Program for healing cancer. Lothar strongly supports holistic and spiritual approach and includes Visualization, Tumor Contract, Meditation, mild Yoga, Emotional Freedom Technique EFT, Dr. Ryke Geerd Hamer's New German Medicine (Connection of unresolved stress and cancer), Detoxification techniques (Soda Bicarb bath, Epsom bath, Colon Hydrotherapy, Coffee Enema etc.) in his so much talked about 3 E Program. The book also, describes about rare and miraculous herbs used in the treatment of Cancer like Turmeric, Black seed, Ginger, Mistle Toe, Aloe vera, Echinacea, Lobelia, Essiac Tea, Pau d'arco Tea, Dandelion, Milk Thistle.

**Pharmaceutical Biotechnology** McGraw-Hill Education / Medical Solvent systems are integral to drug development and pharmaceutical technology. This single topic encompasses numerous allied subjects running the gamut from recrystallization solvents to biorelevant media. The goal of this contribution to the AAPS Biotechnology: Pharmaceutical Aspects series is to generate both a practical handbook as well as a reference allowing the reader to make effective decisions concerning the use of solvents and solvent systems. To this end, the monograph was created by inviting recognized experts from a number of fields to author relevant sections. Specifically, 15 chapters have been designed covering the theoretical background of solubility, the effect of ionic equilibria and pH on solubilization, the use of solvents to effect drug substance crystallization and polymorph selection, the use of solvent systems in high throughput screening and early discovery, solvent use in preformulation, the use of solvents in bio-relevant dissolution and permeation experiments, solvents and their use as toxicology vehicles, solubilizing media and excipients in oral and parenteral formulation development, specialized vehicles for protein formulation and solvent systems for topical and pulmonary drug administration. The chapters are organized such that useful decision trees are included together with the scientific underpinning for their application. In addition, trends in the use of solvent systems and a balance of current views make this monograph useful to both the novice and experienced researcher and to scientists at all developmental stages from early discovery to late pharmaceutical operations.

**Handbook of Bioequivalence Testing** CRC Press

Pharmaceutical Biotechnology is a unique compilation of reviews addressing frontiers in biologicals as a rich source for innovative medicines. This book fulfills the needs of a broad community of scientists interested in biologicals from diverse perspectives—basic research, biotechnology, protein engineering, protein delivery, medicines, pharmaceuticals and vaccinology. The diverse topics range from advanced biotechnologies aimed to introduce novel, potent engineered vaccines of unprecedented efficacy and safety for a wide scope of human diseases to natural products, small peptides and polypeptides engineered for discrete prophylaxis and therapeutic purposes. Modern biologicals promise to dramatically expand the scope of preventive medicine beyond the infectious disease arena into broad applications in immune and cancer treatment,

as exemplified by anti-EGFR receptors antibodies for the treatment of breast cancer. The exponential growth in biologicals such as engineered proteins and vaccines has been boosted by unprecedented scientific breakthroughs made in the past decades culminating in an in-depth fundamental understanding of the scientific underpinnings of immune mechanisms together with knowledge of protein and peptide scaffolds that can be deliberately manipulated. This has in turn led to new strategies and processes. Deciphering the human, mammalian and numerous pathogens' genomes provides opportunities that never before have been available—identification of discrete antigens (genomes and antigenomes) that lend themselves to considerably improved antigens and monoclonal antibodies, which with more sophisticated engineered adjuvants and agonists of pattern recognition receptors present in immune cells, deliver unprecedented safety and efficacy. Technological development such as nanobiotechnologies (dendrimers, nanobodies and fullerenes), biological particles (viral-like particles and bacterial ghosts) and innovative vectors (replication-competent attenuated, replication-incompetent recombinant and defective helper-dependent vectors) fulfill a broad range of cutting-edge research, drug discovery and delivery applications. Most recent examples of breakthrough biologicals include the human papilloma virus vaccine (HPV, prevention of women genital cancer) and the multivalent Pneumococcal vaccines, which has virtually eradicated in some populations a most prevalent bacterial ear infection (i.e., otitis media). It is expected that in the years to come similar success will be obtained in the development of vaccines for diseases which still represent major threats for human health, such as AIDS, as well as for the generation of improved vaccines against diseases like pandemic flu for which vaccines are currently available. Furthermore, advances in comparative immunology and innate immunity revealed opportunities for innovative strategies for ever smaller biologicals and vaccines derived from species such as llama and sharks, which carry tremendous potential for innovative biologicals already in development stages in many pharmaceutical companies. Such recent discoveries and knowledge exploitations hold the promise for breakthrough biologicals, with the coming decade. Finally, this book caters to individuals not directly engaged in the pharmaceutical drug discovery process via a chapter outlining discovery, preclinical development, clinical development and translational medicine issues that are critical the drug development process. The authors and editors hope that this compilation of reviews will help readers rapidly and completely update knowledge and understanding of the frontiers in pharmaceutical biotechnologies.
