Serving students with academic deficiencies necessitates communication and collaboration among professionals from several disciplines. Academic Assessment and Intervention brings together divergent approaches in order to demonstrate that scientific evidence, rather than biases or previous practice, must determine assessment practices that are selected and used for particular purposes.

Similar to a handbook in its comprehensive topical coverage, this edited collection provides a contextual foundation for academic assessment and intervention; describes both norm-referenced and curriculum-based assessment/measurement in detail; considers the implications of both of these assessments on ethnically diverse populations; provides a clear link between assessment, evidence-based interventions and the RTI model; and considers other important topics related to this area such as teacher behavior. Intended primarily for graduate-level courses in education, school psychology, or child clinical psychology, it will also be of interest to practicing professionals in these fields.

For more than 30 years, numerous independent reviewers, student advice writers and even competitors have heralded

HERGENHAHN'S AN INTRODUCTION TO THE HISTORY OF PSYCHOLOGY as the best in the field--and for good reason.

It was the first History of Psychology text to include basic pedagogy--elements such as summaries and study questions that several current alternatives still lack. It engages students with interesting biographical tidbits--the fun facts that readers fondly remember after other details fade. Grounded in original source material and contemporary scholarship, the book provides breadth and depth of analysis unrivaled by works of similar length. In the eighth edition, author Tracy Henley continues to demonstrate that

most of the concerns of contemporary psychologists are manifestations of themes that have been part of Psychology for hundreds--or even thousands--of years. Important Notice: Media content referenced within the product description or the product text may not be available in the ebook version.

Mind Design: The Adaptive Organization of Human Nature, Minds, and Behavior does what most books on the subject don't do. It deals with the “big questions” in psychology and philosophy from an evolutionary neuroscience perspective. This highly readable volume provides a provocative look at the evolutionary origins and neurophysiological underpinnings of mind—including free will, the self, biological origins of the duality of human moral nature, human mate value and mate selection, the sensory/perceptual systems as adaptive virtual reality machines, and the emotions, intelligence, and consciousness as evolved psychological adaptations.

Discovering the Scientist Within is the only book on the market that teaches students about research methods using a case study approach. All the design-focused chapters present students with a single study described from start to finish. The chapter starts by asking students to consider a scenario and then walks them through the steps of the study: formulating a research question, performing a literature review, constructing a data collection method, considering ethics, refining the method, gathering data, understanding the statistical results, and reporting the results in APA style. Students come away with a practical understanding of the research process and useful practice in the basic steps that comprise all studies. The book also has excellent pedagogy, starting with clear Learning Outcomes at the beginning of each chapter, "Your Turn" assessments as the end of each section, and end-of-chapter Review Questions and Applying What You've Learned activities. As part of their class projects, students are often asked to run some statistics and write in APA style. This text has ample support for both, including Appendices on both topics, as well as in-chapter material modeling writing and reporting in APA style. Best of all, the book comes integrated with new Research in

Action activities from the same author team. These activities extend the core mission of the book by putting students in the role of a researcher and simulating the kinds of decisions they would face in conceptualizing and executing a study. Each chapter includes an activity (a few chapters have more than one), and the activities are called out in the chapter. The new edition features coverage of "fake news," as well as "Our Research Plan at a Glance," a summary of the study featured in each chapter. The book is also available in a LaunchPad course for the first time. Students will have access to the full eBook, the LearningCurve adaptive quizzing system, the Research in Action activities, and other resources. This book also comes with an unprecedented set of instructor supplements, many of them prepared by the authors themselves. These include a full instructor's manual, including supplemental examples for each chapter, suggestions for in-class activities and demonstrations, lab/group project ideas, a feature designed to enhance psychological/information literacy, and suggestions for using end of chapter materials. Instructors also get access to unique PowerPoint slide decks that incorporate the same active learning and hands-on approach as the textbook. Chapter PowerPoint slides include additional examples, discussion questions, demonstrations and activities built right into the presentation to help bring the material to life. For design chapters, they provide two sets of PowerPoint slides: one set that incorporates the chapter's research question and a more traditional set that focuses on key concepts.
